Spatiotemporal Data Visualization with Python

A Course for Undergraduate Students

@Southern University of Science and Technology

Xinyu Chen

March 31, 2023

南方科技大学

SUSTech Southern University of Science and Technology

Content

A quick look...

-

Target

Throughout this class, you will:

- Understand some basic concepts of spatiotemporal data
- Code and compute with spatiotemporal data in Python
- Visualize and analyze spatiotemporal data

Sources

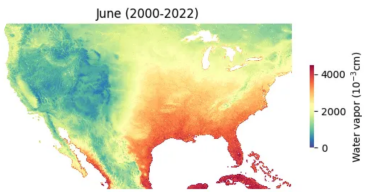
- Slides: https://xinychen.github.io/slides/visual_stdata.pdf
- Examples: https://spatiotemporal-data.github.io

Research Interests

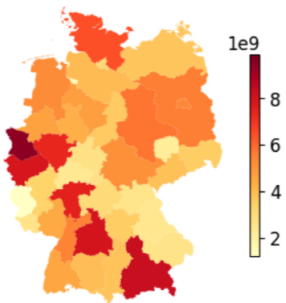
- Machine Learning (e.g., Matrix/Tensor computations, numerical optimization, supervised/unsupervised learning)
- Data Mining (e.g., Spatiotemporal data modeling, geospatial data analysis)

Transportation

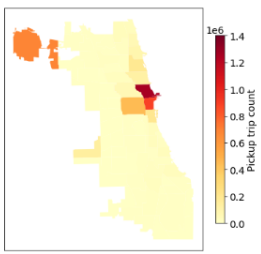
Mobile service



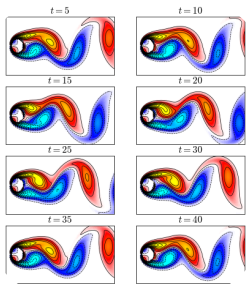
Climate



Energy



Mobility



Dynamical system

- AI for Science (e.g., Urban science, dynamical systems, computational social science)

Past Works

Open-source & reproducible research:

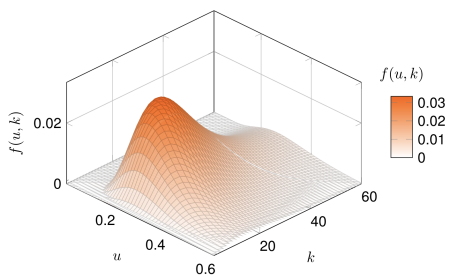
- https://github.com/xinychen

Algorithms

`transdim`

(1.1k stars)

Tools



`awesome-latex-drawing`

(1.2k stars)

Tutorials

`latex-cookbook`

(1.2k stars)

(THU Press)

Spatiotemporal Data Modeling (STD) Initiative

- Homepage: https://spatiotemporal-data.github.io
- Areas: Data science & machine learning & AI for science
- What will we do?
  - Coding and computing with data
  - Posting scientific questions
  - Supporting open-source and reproducible research

Matching Taxi Trips with Community Areas

There are three basic steps to follow for processing taxi trip data:

- Download taxi trips in 2022 in the `.csv` format, e.g., `Taxi_Trips_-_2022.csv`.
- Use the `pandas` package in Python to process the raw trip data.
- Match trip pickup/dropoff locations with boundaries of the community area.

```
import pandas as pd

data = pd.read_csv('Taxi_Trips_-_2022.csv')
data.head()
```

For each taxi trip, one can select some important information:

- `Trip Start Timestamp`: When the trip started, rounded to the nearest 15 minutes.
- `Trip Seconds`: Time of the trip in seconds.
- `Trip Miles`: Distance of the trip in miles.
- `Pickup Community Area`: The Community Area where the trip began. This column will be blank for locations ourside Chicago.
- `Dropoff Community Area`: The Community Area where the trip ended. This column will be blank for locations outside Chicago.

```
df = pd.DataFrame()
df['Trip Start Timestamp'] = data['Trip Start Timestamp']
df['Trip Seconds'] = data['Trip Seconds']
df['Trip Miles'] = data['Trip Miles']
df['Pickup Community Area'] = data['Pickup Community Area']
df['Dropoff Community Area'] = data['Dropoff Community Area']
del data
df
```

Figure 2 shows taxi pickup and dropoff trips (2022) on 77 community areas in the City of Chicago. Note that the average trip duration is **1207.75 seconds** and the average trip distance is **6.16 miles**.

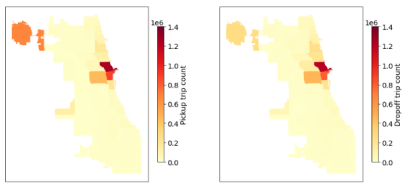


Figure 2. Taxi pickup and dropoff trips (2022) in the City of Chicago, USA. There are 4,763,961 remaining trips after the data processing.

For comparison, Figure 3 shows taxi pickup and dropoff trips (2019) on 77 community areas in the City of Chicago. Note that the average trip duration is **915.62 seconds** and the average trip distance is **3.93 miles**.

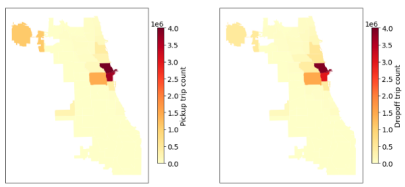

Figure 3. Taxi pickup and dropoff trips (2019) in the City of Chicago, USA. There are 12,484,572 remaining trips after the data processing. See the data processing codes.

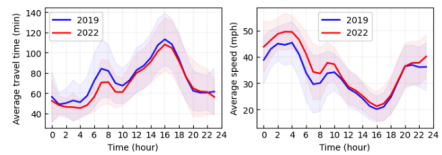

Figure 6. Average travel time and speed from area 32 (i.e., Downtown) to area 76 (i.e., Airport) in both 2019 and 2022.

```
import numpy as np
import matplotlib.pyplot as plt

fig = plt.figure(figsize = (8, 2.5))
ax = fig.add_subplot(1, 2, 1)
# Average travel time in 2019
m1 = df1.groupby(['hour'])['Trip Seconds'].mean().values / 30
s1 = df1.groupby(['hour'])['Trip Seconds'].std().values / 30
plt.plot(m1, color = 'blue', linewidth = 1.8, label = '2019')
upper = m1 + s1
lower = m1 - s1
x_bound = np.append(np.append(np.append(np.array([0, 0]), np.arange(0, 24)),
                              np.array([24 - 1, 24 - 1])), np.arange(24 - 1, -1,
y_bound = np.append(np.append(np.append(np.array([upper[0], lower[0]]), lower),
                              np.array([lower[-1], upper[-1]])), np.flip(upper))
plt.fill(x_bound, y_bound, color = 'blue', alpha = 0.05)

# Average travel time in 2022
m1 = df2.groupby(['hour'])['Trip Seconds'].mean().values / 30
s1 = df2.groupby(['hour'])['Trip Seconds'].std().values / 30
plt.plot(m1, color = 'red', linewidth = 1.8, label = '2022')
upper = m1 + s1
lower = m1 - s1
```
