Education Mission

“Education is not the learning of facts,
but the training of the mind to think.”

Albert Einstein

- TUM School of Management in Heilbronn:
 - Bachelor in Management & Data Science
 - Master in Management
 - Master in Management & Digital Technology
 - Master in Management & Innovation
- My targets: Fostering **curiosity** and empowering students to take ownership of their learning; Creating **an inclusive and engaging environment** that supports diverse students.

Teaching Methods

Format & Assessment:

- ① Research-based techniques (critical thinking skills)
- ② Insights from guest talks
- ③ Class quiz (problem solving)
- ④ Project-oriented examination (problem solving)
- ⑤ Mid-term/final-term presentation

Classroom is a family:

- ① Making learning fun
- ② Making it as simple and clear as possible
- ② Coffee time for discussion (guidance & support & thought exchange)

Source: [link](#)

Collaboration:

- ① Approaching advanced AI techniques
- ② Building blog posts together (e.g., ICLR Blogposts Track)

Well-documented data files:

- ### Matching Taxi Trips with Community Areas

There are three basic steps to follow for processing taxi trip data:

- Download `taxi trips in 2022` in the `.csv` format, e.g., `Taxi_Trips_2022.csv`.
- Use the `pandas` package in Python to process the raw trip data.
- Match trip pickup/dropoff locations with boundaries of the community area.

```
import pandas as pd

data = pd.read_csv('taxi_trips_-_2022.csv')
data.head()
```

For each taxi trip, one can select some important information:

- **Trip Start Timestamp:** When the trip started, rounded to the nearest 15 minutes.
- **Trip Seconds:** Time of the trip in seconds.
- **Trip Miles:** Distance of the trip in miles.
- **Pickup Community Area:** The Community Area where the trip began. This column will be blank for locations outside Chicago.
- **Dropoff Community Area:** The Community Area where the trip ended. This column will be blank for locations outside Chicago.

```
df = pd.DataFrame()
df['Trip Start Timestamp'] = data['Trip Start Timestamp']
df['Trip Seconds'] = data['Trip Seconds']
df['Trip Miles'] = data['Trip Miles']
df['Pickup Community Area'] = data['Pickup Community Area']
df['Dropoff Community Area'] = data['Dropoff Community Area']
df
```

Figure 2 shows taxi pickup and dropoff trips (2022) on 77 community areas in the City of Chicago. Note that the average trip duration is 1207.75 seconds and the average trip distance is 6.16 miles.

Figure 2. Taxi pickup and dropoff trips (2022) in the City of Chicago, USA. There are 4,763,961 remaining trips after the data processing.

For comparison, Figure 3 shows taxi pickup and dropoff trips (2019) on 77 community areas in the City of Chicago. Note that the average trip duration is **915.62 seconds** and the average trip distance is **3.93 miles**.

Figure 3. Taxi pickup and dropoff trips (2019) in the City of Chicago, USA. There are 12,484,572 remaining trips after the data processing. See [the data processing codes](#).

Figure 6. Average travel time and speed from area 32 (i.e., Downtown) to area 76 (i.e., Airport) in both 2019 and 2022.

```
import numpy as np
import matplotlib.pyplot as plt

fig, plt.figure(figsize=(8, 1.5))
ax = fig.add_subplot(1, 1, 1)

# Generate random time at birth
n1 = df.groupby('house')[['Trip Duration']].median().values / 30
n1 = df.groupby('house')[['Trip Duration']].median().values / 30
plt.plot(n1, color='blue', linewidth=1.5, label='Birth')
upper = n1 + 1
lower = n1 - 1

# Second
x_bound = np.append(x_upper, x_upper, x_upper, x_upper) * 21, ax.set_xlim(0, 21)
y_bound = np.append(y_upper, y_upper, y_upper, y_upper) * 21, ax.set_ylim(0, 21)
ax.set_xlabel('Time', color='black', alpha=0.9)
plt.fill_between(x_bound, y_lower, color='blue', alpha=0.9)

# Generate random time at home
n1 = df.groupby('house')[['Trip Duration']].median().values / 30
n1 = df.groupby('house')[['Trip Duration']].median().values / 30
plt.plot(n1, color='red', linewidth=1.5, label='Home')
upper = n1 + 1
lower = n1 - 1
```

Tutorials

Intuitive understanding of core concepts in data science:

- ❶ Creating graphics
- ❷ Examining with realistic data
- ❸ Developing toy examples
- ❹ Providing Python implementation

Figure 2. Illustration of the circular convolution between $\mathbf{x} = (x_1, x_2, x_3, x_4)^T$ and $\mathbf{y} = (y_1, y_2, y_3)^T$. (a) Computing z_1 involves $x_0 = x_4$ and $x_{-1} = x_3$. (b) Computing z_2 involves $x_0 = x_4$. The figure is inspired by Prince (2023).

Example 2. Given vectors $\mathbf{x} = (0, 1, 2, 3, 4)^T$ and $\mathbf{y} = (2, -1, 3)^T$, the circular convolution $\mathbf{z} = \mathbf{x} * \mathbf{y}$ can be expressed as:

$$\mathbf{z} = \mathbf{x} * \mathbf{y} = \mathbf{C}_3(\mathbf{x})\mathbf{y} = (5, 14, 3, 7, 11)^T$$

where $\mathbf{C}_3(\mathbf{x})$ is the convolution matrix with $\tau = 3$ columns. Specifically, the convolution matrix is structured as follows,

$$\mathbf{C}_3(\mathbf{x}) = \begin{bmatrix} 0 & 4 & 3 \\ 1 & 0 & 4 \\ 2 & 1 & 0 \\ 3 & 2 & 1 \\ 4 & 3 & 2 \end{bmatrix}$$

As a result, it gives

$$\mathbf{z} = \mathbf{C}_3(\mathbf{x})\mathbf{y} = \begin{bmatrix} 0 & 4 & 3 \\ 1 & 0 & 4 \\ 2 & 1 & 0 \\ 3 & 2 & 1 \\ 4 & 3 & 2 \end{bmatrix} \begin{bmatrix} 2 \\ -1 \\ 3 \end{bmatrix} = \begin{bmatrix} 5 \\ 14 \\ 3 \\ 7 \\ 11 \end{bmatrix}$$

This representation shows that the circular convolution is equivalent to a matrix-vector multiplication, making it easier to understand, especially in signal processing applications.
