Modeling Temporal Correlations and Dynamics in Spatiotemporal Data Systems

Xinyu Chen

Postdoctoral Associate, MIT

May 1, 2024

Outline

A quick look:

- Motivation (data, task, and models)
- Traffic data imputation with global/local trend modeling
 - Traffic flow imputation, speed field reconstruction, and network traffic state estimation
- Unsupervised pattern discovery from spatiotemporal systems
 - Time-varying autoregression & tensor factorization
 - Applications to fluid flow (benchmark), sea surface temperature, USA climate, NYC taxi, international trade, and Chicago ridesharing

Motivation

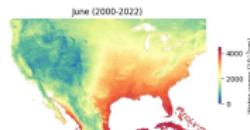

- Spatiotemporal systems & data scenarios

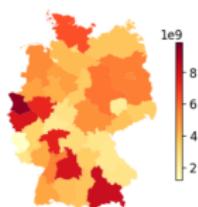

Transportation

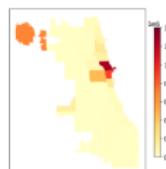

International trade

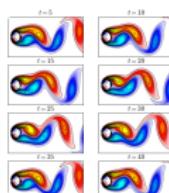

Climate

Energy

Mobility

Fluid flow

- Challenges: Sparsity, time-varying system, multidimensional system (e.g., human mobility)

Prior Art

- Sequence models: Time series autoregression, LSTM, attention-based sequence models, etc.
- Machine learning problems:
 - **Imputation/Interpolation:** Time series models, sparse learning (e.g., matrix/tensor factorization), deep learning (e.g., generative models), etc.
 - **Unsupervised pattern discovery:** Dynamic mode decomposition in dynamical systems, matrix/tensor factorization, etc.
 - **Prediction:** Almost deep learning, but depending on scenarios

Laplacian Convolutional Representation for Traffic Time Series Imputation

2nd round review at
IEEE Transactions on Knowledge and Data Engineering

(coming soon)

Traffic Flow Data

- Portland highway traffic data¹

Highway network & sensor locations

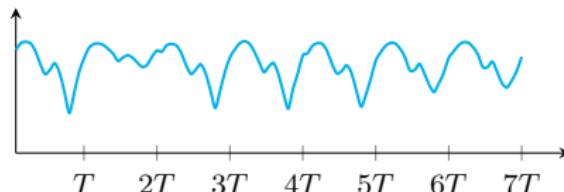

- $X \in \mathbb{R}^{N \times T}$ with N spatial locations $\times T$ time steps
 - Traffic volume/speed shows strong spatial/temporal dependencies

¹<https://portal.its.pdx.edu/home>

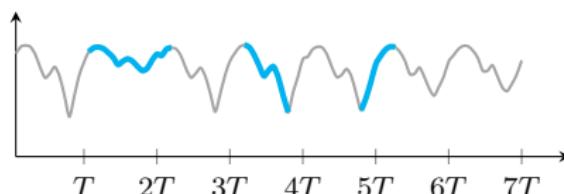

Time Series Imputation

Motivation: Traffic imputation

- Global trends (e.g., long-term quasi-seasonality & daily/weekly rhythm):

- Local trends (e.g., short-term time series trends):

How to characterize both global and local trends in sparse time series?

Local Trend Modeling

- Intuition of (circulant) Laplacian matrix

Undirected and circulant graph

Modeling

$$\mathbf{L} = \begin{bmatrix} 2 & -1 & 0 & 0 & -1 \\ -1 & 2 & -1 & 0 & 0 \\ 0 & -1 & 2 & -1 & 0 \\ 0 & 0 & -1 & 2 & -1 \\ -1 & 0 & 0 & -1 & 2 \end{bmatrix}$$

(Circulant) Laplacian matrix

- Define Laplacian kernel:

$$\boldsymbol{\ell} \triangleq (2, -1, 0, 0, -1)^\top$$

⇓

$$\boldsymbol{\ell} \triangleq (\underbrace{2\tau}_{\text{degree}}, \underbrace{-1, \dots, -1}_{\tau}, 0, \dots, 0, \underbrace{-1, \dots, -1}_{\tau})^\top \in \mathbb{R}^T$$

for any time series $\mathbf{x} = (x_1, \dots, x_T)^\top \in \mathbb{R}^T$.

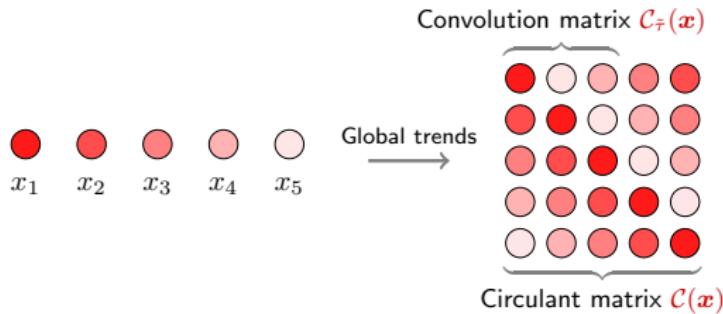

- (Laplacian) Temporal regularization:

$$\mathcal{R}_\tau(\mathbf{x}) = \frac{1}{2} \|\mathbf{L}\mathbf{x}\|_2^2 = \frac{1}{2} \|\boldsymbol{\ell} * \mathbf{x}\|_2^2$$

Reformulate temporal regularization with circular convolution.

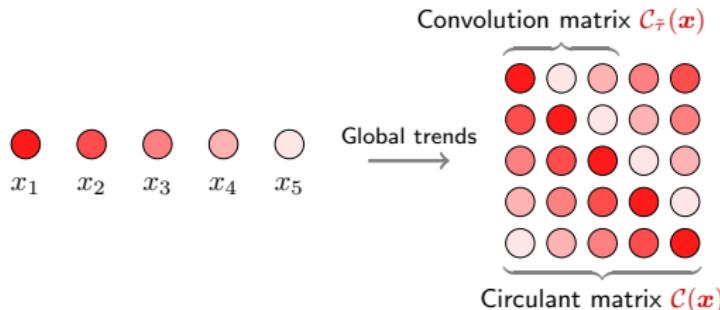

Global Trend Modeling

Circulant matrix $\mathcal{C}(\mathbf{x})$ vs. convolution matrix $\mathcal{C}_{\tilde{\tau}}(\mathbf{x})$

Global Trend Modeling

Circulant matrix $\mathcal{C}(\mathbf{x})$ vs. convolution matrix $\mathcal{C}_{\tilde{\tau}}(\mathbf{x})$

- Circulant/Convolution nuclear norm minimization
 - A balance between global and local trends modeling?

CircNNM (Liu'22, Liu & Zhang'23)

Estimating \mathbf{x} :

$$\begin{aligned} \min_{\mathbf{x}} \quad & \|\mathcal{C}(\mathbf{x})\|_* \\ \text{s.t. } & \|\mathcal{P}_\Omega(\mathbf{x} - \mathbf{y})\|_2 \leq \epsilon \end{aligned}$$

on data \mathbf{y} w/ observed index set Ω .

ConvNNM (Liu'22, Liu & Zhang'23)

Estimating \mathbf{x} :

$$\begin{aligned} \min_{\mathbf{x}} \quad & \|\mathcal{C}_{\tilde{\tau}}(\mathbf{x})\|_* \\ \text{s.t. } & \|\mathcal{P}_\Omega(\mathbf{x} - \mathbf{y})\|_2 \leq \epsilon \end{aligned}$$

on data \mathbf{y} w/ observed index set Ω .

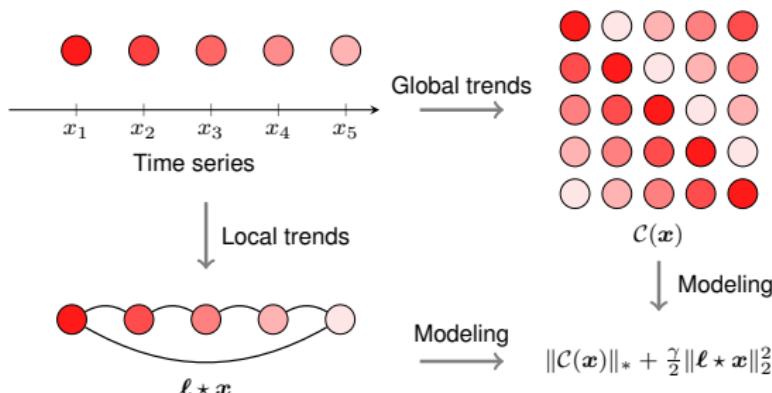

Global + Local Trends?

Laplacian Convolutional Representation (LCR)

For any partially observed time series $\mathbf{y} \in \mathbb{R}^T$ with observed index set Ω , LCR utilizes **circulant matrix** and **Laplacian kernel** to characterize global and local trends in time series, respectively, i.e.,

$$\min_{\mathbf{x}} \underbrace{\|\mathcal{C}(\mathbf{x})\|_*}_{\text{global}} + \frac{\gamma}{2} \underbrace{\|\ell * \mathbf{x}\|_2^2}_{\text{local}}$$

s.t. $\|\mathcal{P}_\Omega(\mathbf{x} - \mathbf{y})\|_2 \leq \epsilon$

Laplacian Convolutional Representation

- Augmented Lagrangian function:²

$$\mathcal{L}(\mathbf{x}, \mathbf{z}, \mathbf{w}) = \|\mathcal{C}(\mathbf{x})\|_* + \frac{\gamma}{2} \|\ell * \mathbf{x}\|_2^2 + \frac{\lambda}{2} \|\mathbf{x} - \mathbf{z}\|_2^2 + \langle \mathbf{w}, \mathbf{x} - \mathbf{z} \rangle + \frac{\eta}{2} \|\mathcal{P}_\Omega(\mathbf{z} - \mathbf{y})\|_2^2$$

- The ADMM scheme:

$$\begin{cases} \mathbf{x} := \arg \min_{\mathbf{x}} \mathcal{L}(\mathbf{x}, \mathbf{z}, \mathbf{w}) & \text{(Nuclear norm minimization)} \\ \mathbf{z} := \arg \min_{\mathbf{z}} \mathcal{L}(\mathbf{x}, \mathbf{z}, \mathbf{w}) & \text{(Closed-form solution)} \\ \mathbf{w} := \mathbf{w} + \lambda(\mathbf{x} - \mathbf{z}) & \text{(Standard update)} \end{cases}$$

- Optimize \mathbf{x} ?

$$\underbrace{\|\mathcal{C}(\mathbf{x})\|_* = \|\mathcal{F}(\mathbf{x})\|_1}_{\text{property of circulant matrix}} \quad \& \quad \underbrace{\frac{1}{2} \|\ell * \mathbf{x}\|_2^2 = \frac{1}{2T} \|\mathcal{F}(\ell) \circ \mathcal{F}(\mathbf{x})\|_2^2}_{\text{property of circular convolution}}$$

Nuclear norm minimization \Rightarrow **ℓ_1 -norm minimization with FFT** in $\mathcal{O}(T \log T)$ time.

² $\mathbf{w} \in \mathbb{R}^T$ (Lagrange multiplier); $\langle \cdot, \cdot \rangle$ (inner product).

Laplacian Convolutional Representation

- Optimize \mathbf{x} via FFT (in $\mathcal{O}(T \log T)$ time):

$$\begin{aligned}\mathbf{x} &:= \arg \min_{\mathbf{x}} \|\mathcal{C}(\mathbf{x})\|_* + \frac{\gamma}{2} \|\ell \star \mathbf{x}\|_2^2 + \frac{\lambda}{2} \|\mathbf{x} - \mathbf{z} + \mathbf{w}/\lambda\|_2^2 \\ \implies \hat{\mathbf{x}} &:= \arg \min_{\hat{\mathbf{x}}} \|\hat{\mathbf{x}}\|_1 + \frac{\gamma}{2T} \|\hat{\ell} \circ \hat{\mathbf{x}}\|_2^2 + \frac{\lambda}{2T} \|\hat{\mathbf{x}} - \hat{\mathbf{z}} + \hat{\mathbf{w}}/\lambda\|_2^2\end{aligned}$$

where we introduce $\{\hat{\ell}, \hat{\mathbf{x}}, \hat{\mathbf{z}}, \hat{\mathbf{w}}\} \triangleq \mathcal{F}\{\ell, \mathbf{x}, \mathbf{z}, \mathbf{w}\}$ (i.e., FFT).

ℓ_1 -norm Minimization in Complex Space (Liu & Zhang'23)

For any optimization problem in the form of ℓ_1 -norm minimization in complex space:

$$\min_{\hat{\mathbf{x}}} \|\hat{\mathbf{x}}\|_1 + \frac{\delta}{2} \|\hat{\mathbf{x}} - \hat{\mathbf{h}}\|_2^2$$

with complex-valued $\hat{\mathbf{x}}, \hat{\mathbf{h}} \in \mathbb{C}^T$ and weight parameter δ , element-wise, the solution is given by

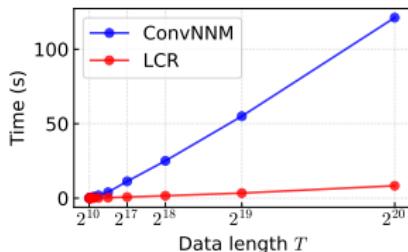

$$\hat{x}_t := \frac{\hat{h}_t}{|\hat{h}_t|} \cdot \max\{0, |\hat{h}_t| - 1/\delta\}, t = 1, \dots, T.$$

Laplacian Convolutional Representation

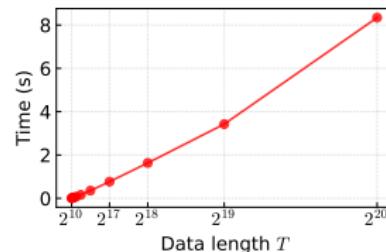

Empirical time complexity

On the synthetic data $\mathbf{y} \in \mathbb{R}^T$ with $T \in \{2^{10}, 2^{11}, \dots, 2^{20}\}$

- Ours: **LCR**
 - An FFT implementation in $\mathcal{O}(T \log T)$
 - The logarithmic factor $\log T$ makes the FFT highly efficient
- Baseline: **ConvNNM** (Liu'22, Liu & Zhang'23)
 - Convolution matrix $\mathcal{C}_{\tilde{\tau}}(\mathbf{y}) \in \mathbb{R}^{T \times \tilde{\tau}}$ with kernel size $\tilde{\tau} = 2^4$
 - Singular value thresholding in $\mathcal{O}(\tilde{\tau}^2 T)$

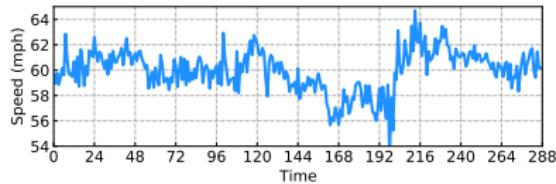

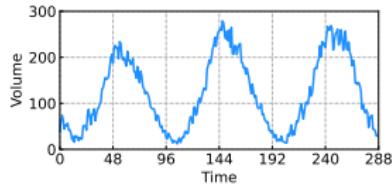

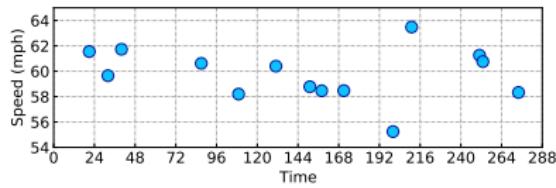

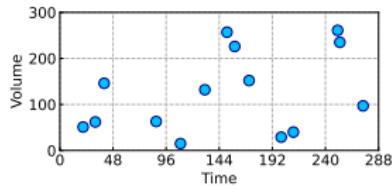

ConvNNM vs. LCR

LCR

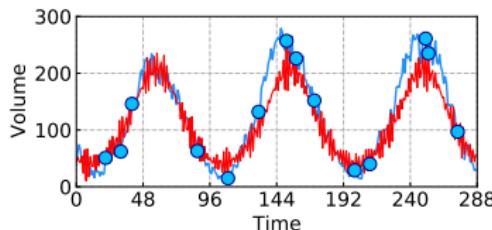

Experiments

- How to utilize the global trends of traffic time series?
- How to produce local consistency of traffic data?

Experiments

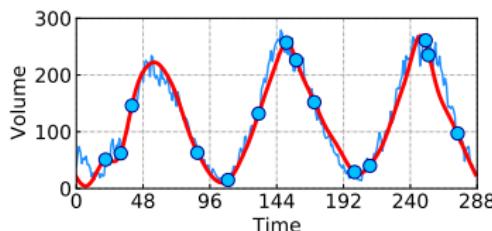

- Substantial performance gains?

CircNNM:

$$\begin{aligned} \min_{\boldsymbol{x}} \quad & \|\mathcal{C}(\boldsymbol{x})\|_* \\ \text{s. t. } \quad & \|\mathcal{P}_\Omega(\boldsymbol{x} - \boldsymbol{y})\|_2 \leq \epsilon \end{aligned}$$

↓ Plus **local** time series trends

LCR:

$$\begin{aligned} \min_{\boldsymbol{x}} \quad & \|\mathcal{C}(\boldsymbol{x})\|_* + \frac{\gamma}{2} \|\boldsymbol{\ell} * \boldsymbol{x}\|_2^2 \\ \text{s. t. } \quad & \|\mathcal{P}_\Omega(\boldsymbol{x} - \boldsymbol{y})\|_2 \leq \epsilon \end{aligned}$$

Experiments

- The start data points and end data points are connected?

 Undirected and circulant graph

Modeling \longrightarrow $L = \begin{bmatrix} 2 & -1 & 0 & 0 & -1 \\ -1 & 2 & -1 & 0 & 0 \\ 0 & -1 & 2 & -1 & 0 \\ 0 & 0 & -1 & 2 & -1 \\ -1 & 0 & 0 & -1 & 2 \end{bmatrix}$

(Circulant) Laplacian matrix

- Flipping operation on $x \in \mathbb{R}^5$:

$$x_{\text{new}} = \begin{bmatrix} x \\ Jx \end{bmatrix} = (\underbrace{x_1, x_2, x_3, x_4, x_5}_{\text{original time series}}, \underbrace{x_5, x_4, x_3, x_2, x_1}_{\text{flipped time series}})^T \in \mathbb{R}^{10}$$

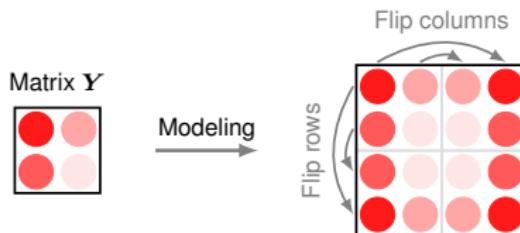

where $J \in \mathbb{R}^{5 \times 5}$ is the exchange matrix.

- Potential applications: Passenger flow prediction with strong global/local trends

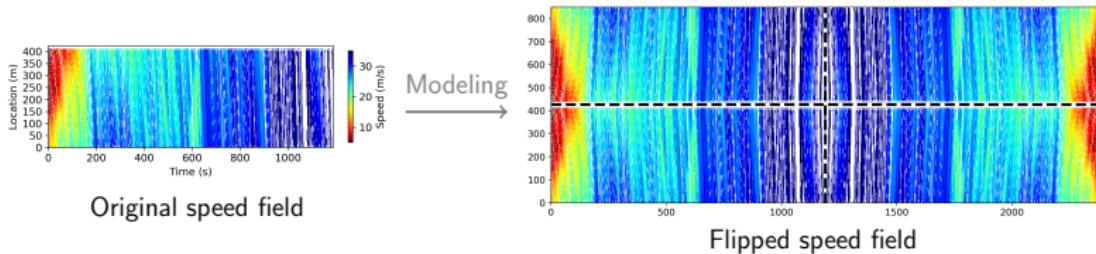

Experiments

Speed field reconstruction³

- Flipping operation on a matrix:

- Flipping operation on a speed field of vehicular traffic flow:

³Highway Drone (HighD) dataset at <https://www.hightd-dataset.com/>

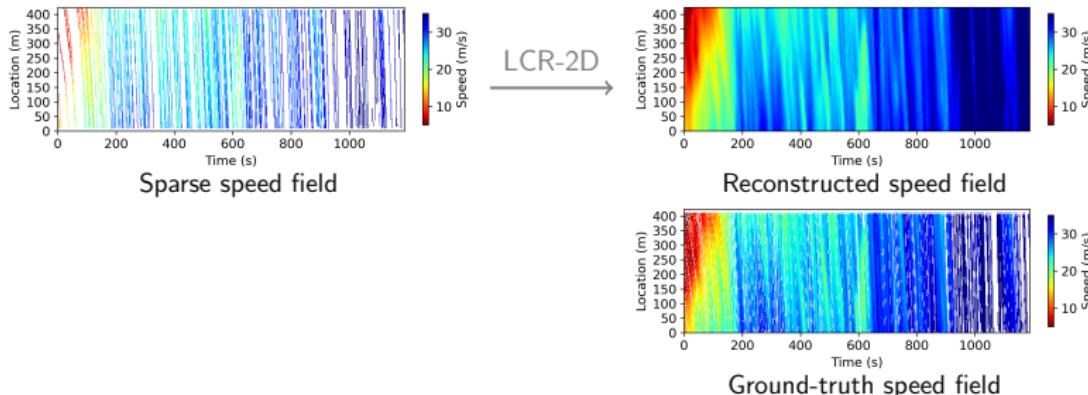

Experiments

Speed field reconstruction⁴

- Scenario: Mask trajectories of 70% vehicles
- LCR-2D on partially observed $\mathbf{Y} \in \mathbb{R}^{N \times T}$:

$$\min_{\mathbf{X}} \underbrace{\|\mathcal{C}(\mathbf{X})\|_*}_{\text{global trend}} + \frac{\gamma}{2} \underbrace{\|(\ell_s \ell^\top) * \mathbf{X}\|_F^2}_{\text{local trend}}$$

s.t. $\|\mathcal{P}_\Omega(\mathbf{X} - \mathbf{Y})\|_F \leq \epsilon$

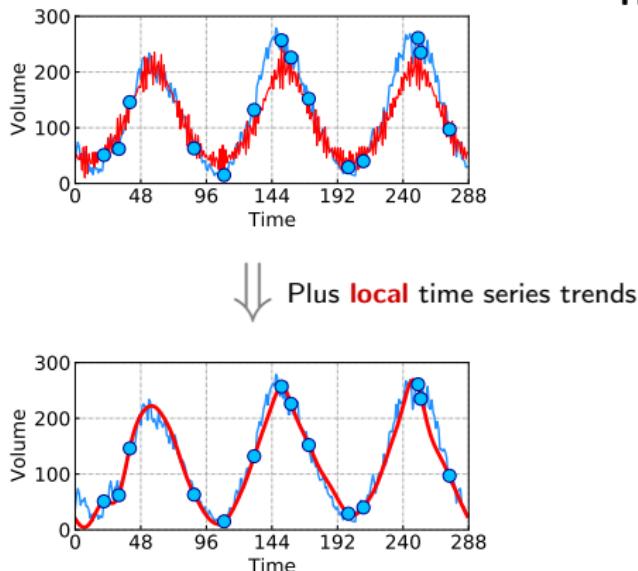

⁴Highway Drone (HighD) dataset at <https://www.hightd-dataset.com/>

Contributions

| | | | |
|--|---|--|---|

| Circulant/Convolution nuclear norm ($\ \mathcal{C}(\mathbf{x})\ _*$ or $\ \mathcal{C}_{\tilde{\tau}}(\mathbf{x})\ _*$) minimization | Low-rank Hankel matrix/tensor ($\mathcal{H}_r(\cdot)$) completion | Tensor nuclear norm minimization with linear transform | Generalized nonconvex nonsmooth low-rank minimization |
| Liu'22 Liu & Zhang'23 | Yokota et al.'18 Sedighin et al.'20 Cai et al.'21 Yamamoto et al.'22 | Lu et al.'19 | Lu et al.'14 |

(Ours) LCR:

- ✓ Local trend modeling
- ✓ An FFT implementation

Highlights:

- Rethinking the importance of local trend modeling in traffic data imputation tasks.
- Finding a unified **global and local trend** modeling framework whose optimization can be efficiently solved by **FFT**:

$$\min_{\mathbf{x}} \underbrace{\|\mathcal{C}(\mathbf{x})\|_*}_{\text{global}} + \frac{\gamma}{2} \underbrace{\|\ell * \mathbf{x}\|_2^2}_{\text{local}}$$

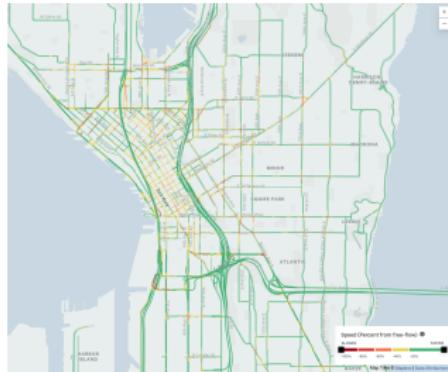

$$\text{s. t. } \|\mathcal{P}_\Omega(\mathbf{x} - \mathbf{y})\|_2 \leq \epsilon$$

Vision & Insight

- Uber (hourly) movement speed data⁵

NYC movement

Seattle movement

- {road segment, time slot (hour), average speed}
- Computing hourly speed: Road segments have 5+ unique trips.
- Estimating network-wide traffic states for traffic planning & management.
(Data/model biases/fairness concerns for imputation, interpolation, and prediction.)

Dynamic Autoregressive Tensor Factorization for Pattern Discovery of Spatiotemporal Systems

International Trade & Ridesharing Mobility

Autoregression

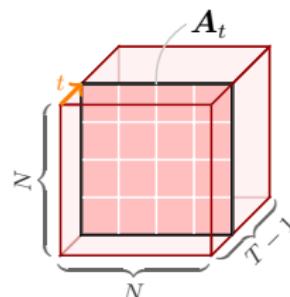

- How to characterize dynamical systems?

- On spatiotemporal systems $\mathbf{Y} \in \mathbb{R}^{N \times T}$:

$$\underbrace{\mathbf{y}_{t+1} = \mathbf{A}\mathbf{y}_t + \epsilon_t}_{\text{time-invariant (e.g., DMD)}} \quad \text{v.s.} \quad \underbrace{\mathbf{y}_{t+1} = \mathbf{A}_t \mathbf{y}_t + \epsilon_t}_{\text{time-varying}}$$

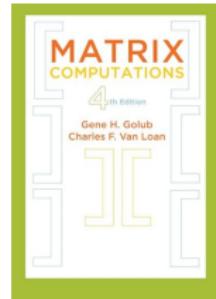

- How to discover spatial/temporal modes (patterns) from the tensor $\mathcal{A} \triangleq \{\mathbf{A}_t\}_{t \in [T-1]}$?

DATF

- Tensor factorization:

$$\mathcal{A} = \underbrace{\mathcal{G} \times_1 \mathbf{W} \times_2 \mathbf{V} \times_3 \mathbf{X}}_{\text{Tucker decomposition}}$$
$$\Downarrow$$
$$\mathbf{A}_t = \mathcal{G} \times_1 \underbrace{\mathbf{W}}_{\text{spatial modes}} \times_2 \mathbf{V} \times_3 \underbrace{\mathbf{x}_t^\top}_{\text{temporal modes}}$$

- (Ours) Dynamic autoregressive tensor factorization (DATF):

$$\min_{\mathcal{G}, \mathbf{W}, \mathbf{V}, \mathbf{X}} \frac{1}{2} \sum_{t \in [T-1]} \|\mathbf{y}_{t+1} - (\mathcal{G} \times_1 \mathbf{W} \times_2 \mathbf{V} \times_3 \mathbf{x}_t^\top) \mathbf{y}_t\|_2^2$$

s.t. $\underbrace{\mathbf{W}^\top \mathbf{W} = \mathbf{I}_R}_{\text{orthogonal spatial modes}}$

- Solution: \mathcal{G} (LS) \rightarrow \mathbf{W} (OPP) \rightarrow \mathbf{V} (CG) \rightarrow \mathbf{x}_t (LS)

- **Orthogonal Procrustes problem:**

For any $\mathbf{Q} \in \mathbb{R}^{m \times r}$, $m \geq r$, the solution to

$$\min_{\mathbf{F}} \|\mathbf{F} - \mathbf{Q}\|_F^2$$

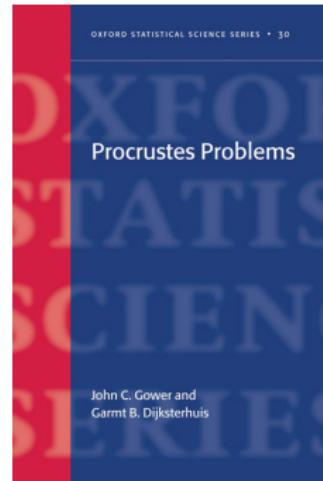

$$\text{s. t. } \underbrace{\mathbf{F}^\top \mathbf{F} = \mathbf{I}_r}_{\text{orthogonal}}$$

is

$$\mathbf{F} := \mathbf{U}\mathbf{V}^\top$$

where

$$\underbrace{\mathbf{Q} = \mathbf{U}\Sigma\mathbf{V}^\top}_{\text{singular value decomposition}}$$

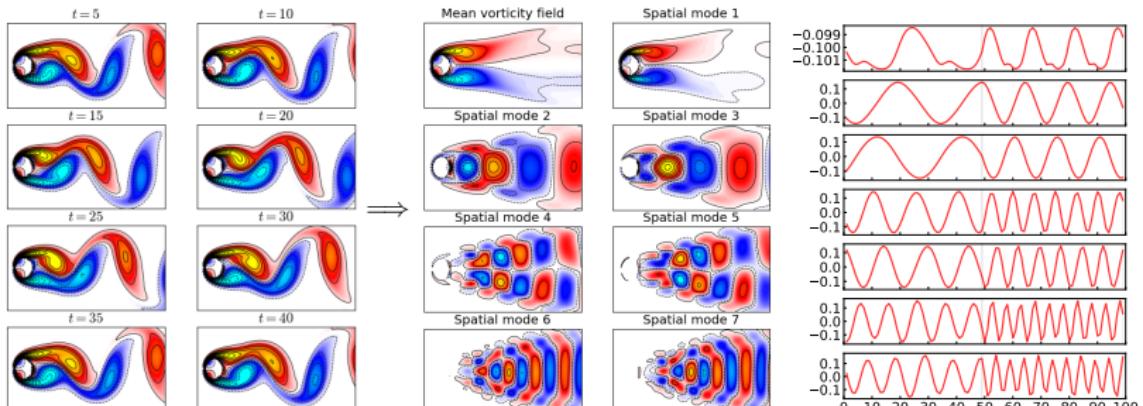

- Equivalent form:

$$\|\mathbf{F} - \mathbf{Q}\|_F^2 = \text{tr}(\underbrace{\mathbf{F}^\top \mathbf{F} - \mathbf{F}^\top \mathbf{Q} - \mathbf{Q}^\top \mathbf{F} + \mathbf{Q}^\top \mathbf{Q}}_{= \mathbf{I}_r \text{ const.}}) = -2 \text{tr}(\mathbf{F}^\top \mathbf{Q}) + \text{const.}$$

$$\implies \mathbf{F} =: \arg \min_{\mathbf{F}^\top \mathbf{F} = \mathbf{I}_r} \|\mathbf{F} - \mathbf{Q}\|_F^2 = \arg \max_{\mathbf{F}^\top \mathbf{F} = \mathbf{I}_r} \text{tr}(\mathbf{F}^\top \mathbf{Q})$$

Benchmark Evaluation

- **Multi-resolution fluid flow dataset** (the first 50 snapshots + 50 snapshots randomly selected from the last 100 snapshots)
 - Produce interpretable patterns: Low-frequency modes (dominant patterns) & high-frequency modes (e.g., secondary patterns, outliers)
 - Identify the system of different frequencies (i.e., at $t = 50$)

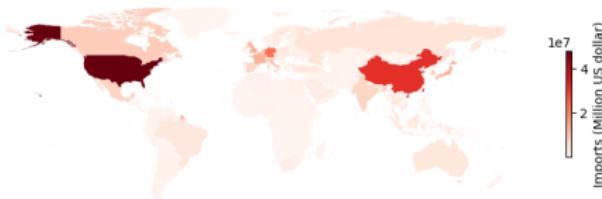

Vectorize snapshots as $\{y_t\}_t$

Spatial modes in W

Temporal modes in X

International Trade

- Import/Export merchandise trade values (annual)⁸ (215 countries/regions & period of 2000-2022)
 - Total merchandise trade values
 - Represent import/export trade data as a 215-by-23 matrix

Imports from 2000 to 2022

Exports from 2000 to 2022

s.t.
$$\underbrace{\mathbf{W}^\top \mathbf{W} = \mathbf{I}_R}_{\text{orthogonal origin patterns}}$$

Human Mobility

• Chicago taxi/ridesharing data

Matching Taxi Trips with Community Areas

There are three basic steps to follow for processing taxi trip data:

- Download taxi trips in 2022 in the `.csv` format, e.g., `Taxi_Trips_-_2022.csv`.
- Use the `pandas` package in Python to process the raw trip data.
- Match trip pickup/dropoff locations with boundaries of the community area.

```
import pandas as pd
data = pd.read_csv('Taxi_Trips_-_2022.csv')
data.head()
```

For each taxi trip, one can select some important information:

- **Trip Start Timestamp**: Time of the trip started, rounded to the nearest 15 minutes.
- **Trip Seconds**: Time of the trip in seconds.
- **Trip Miles**: Distance of the trip in miles.
- **Pickup Community Area**: The Community Area where the trip began. This column will be blank for locations outside Chicago.
- **Dropoff Community Area**: The Community Area where the trip ended. This column will be blank for locations outside Chicago.

```
# df['Trip Start Timestamp'] = data['Trip Start timestamp']
df['Trip Seconds'] = data['Trip Seconds']
df['Trip Miles'] = data['Trip Miles']
df['Pickup Community Area'] = data['Pickup Community Area']
df['Dropoff Community Area'] = data['Dropoff Community Area']
data
df
```

Figure 2 shows taxi pickup and dropoff trips (2022) on 77 community areas in the City of Chicago. Note that the average trip duration is 1207.75 seconds and the average trip distance is 8.16 miles.

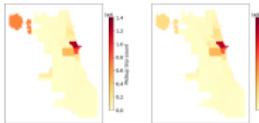

Figure 2. Taxi pickup and dropoff trips (2022) in the City of Chicago, USA. There are 4,763,961 remaining trips after the data processing.

For comparison, Figure 3 shows taxi pickup and dropoff trips (2019) on 77 community areas in the City of Chicago. Note that the average trip duration is 915.62 seconds and the average trip distance is 3.93 miles.

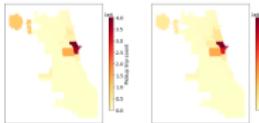

Figure 3. Taxi pickup and dropoff trips (2019) in the City of Chicago, USA. There are 12,484,572 remaining trips after the data processing. See the data processing codes.

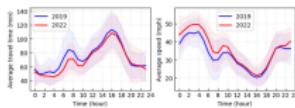

Figure 4. Average travel time and speed from area 32 (i.e., Downtown) to area 76 (i.e., Airport) in both 2019 and 2022.

```
import numpy as np
import matplotlib.pyplot as plt

fig = plt.figure(figsize=(4, 2.5))
ax = fig.add_subplot(1, 2, 1)
# Average travel time in 2019
st = df.groupby(['Hour'])['Trip Seconds'].mean().values / 30
st = df.groupby(['Hour'])['Trip Seconds'].std().values / 30
plt.plot(st, color = 'blue', linewidth = 1.0, label = '2019')
upper = st + st
lower = st - st
x_bound = np.append(np.append(np.append(np.array([0, 0]), np.arange(0, 24)), np.array([-1, -1, -1])), np.arange(24, 25, -1))
y_bound = np.append(np.append(np.append(np.array([0, 0]), np.arange(0, 24)), np.array([-1, -1, -1])), np.arange(24, 25, -1))
plt.fill(y_bound, x_bound, value = 'blue', alpha = 0.2)
plt.title('Average travel time in 2019')

st = df.groupby(['Hour'])['Trip Seconds'].mean().values / 30
st = df.groupby(['Hour'])['Trip Seconds'].std().values / 30
plt.plot(st, color = 'red', linewidth = 1.0, label = '2022')
upper = st + st
lower = st - st
x_bound = np.append(np.append(np.append(np.array([0, 0]), np.arange(0, 24)), np.array([-1, -1, -1])), np.arange(24, 25, -1))
y_bound = np.append(np.append(np.append(np.array([0, 0]), np.arange(0, 24)), np.array([-1, -1, -1])), np.arange(24, 25, -1))
plt.fill(y_bound, x_bound, value = 'red', alpha = 0.2)
plt.title('Average travel time in 2022')

# Average speed in 2019
st = df.groupby(['Hour'])['Trip Miles'].mean().values / 30
st = df.groupby(['Hour'])['Trip Miles'].std().values / 30
plt.plot(st, color = 'blue', linewidth = 1.0, label = '2019')
upper = st + st
lower = st - st
x_bound = np.append(np.append(np.append(np.array([0, 0]), np.arange(0, 24)), np.array([-1, -1, -1])), np.arange(24, 25, -1))
y_bound = np.append(np.append(np.append(np.array([0, 0]), np.arange(0, 24)), np.array([-1, -1, -1])), np.arange(24, 25, -1))
plt.fill(y_bound, x_bound, value = 'blue', alpha = 0.2)
plt.title('Average speed in 2019')

Human Mobility

- Ridesharing: 96,642,881 trips in 2019 vs. 57,290,954 trips in 2022

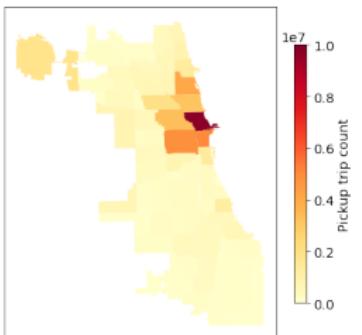

Pickup trips (2019)

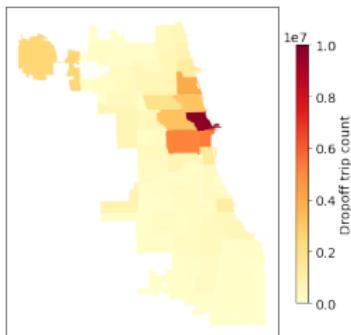

Dropoff trips (2019)

Pickup trips (2022)

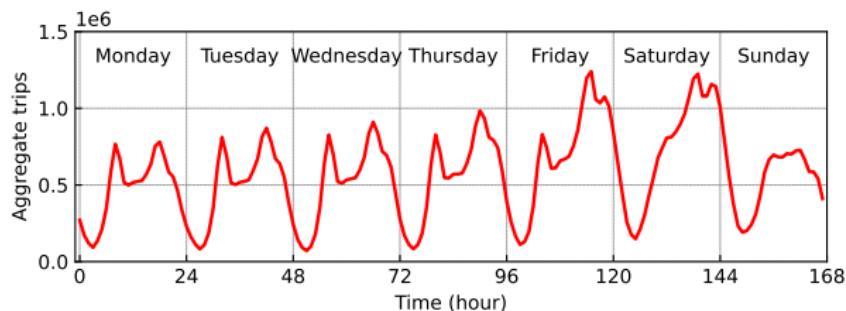

Dropoff trips (2022)

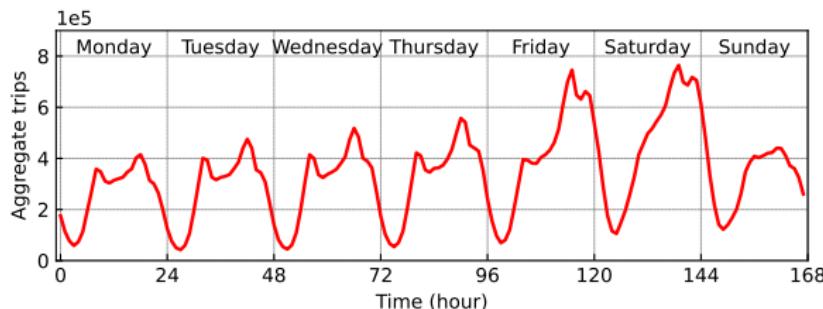

Human Mobility

- Ridesharing: 96,642,881 trips in 2019 vs. 57,290,954 trips in 2022

Pickup trips aggregated over 52 weeks in 2019

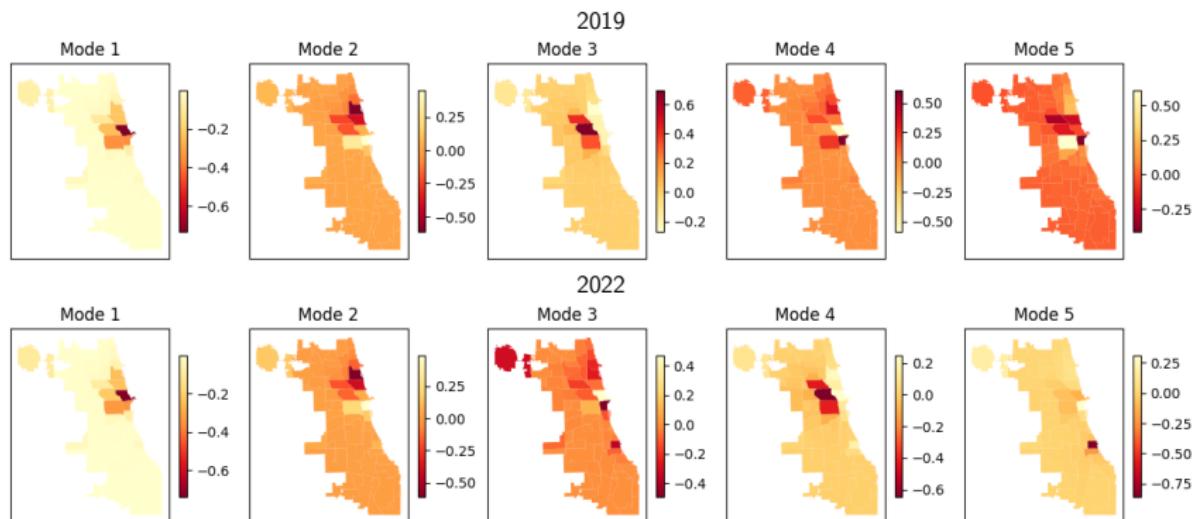

Pickup trips aggregated over 52 weeks in 2022

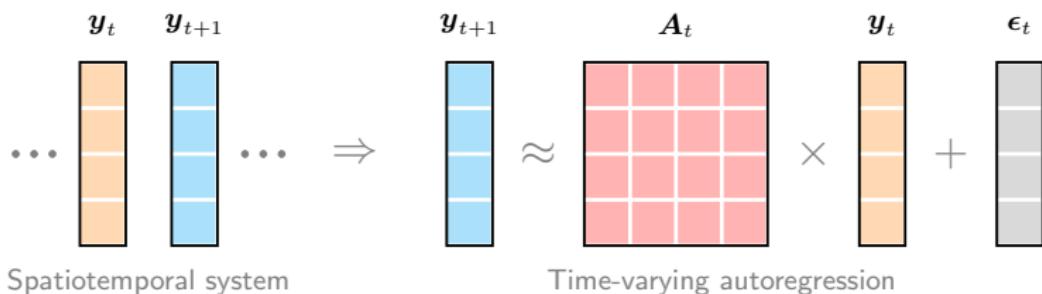

Human Mobility

- Ridesharing trip data: $77 \text{ origins} \times 77 \text{ destinations} \times 168 \text{ hours}$
- Our model Identifies the changes in pickup zones before and after COVID-19

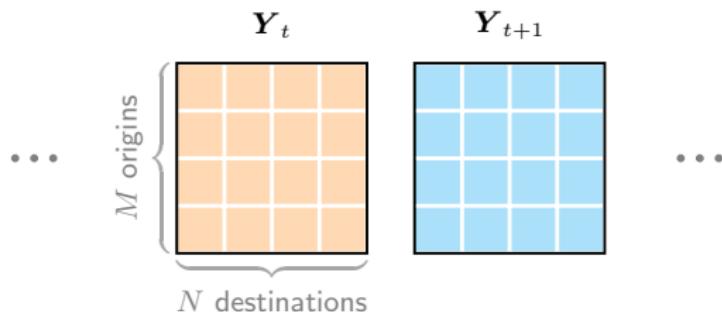

Concluding Remark

- Discovering spatial/temporal patterns from 2D and 3D spatiotemporal systems with unsupervised learning:
 - Time-varying system assumption
 - Tensor factorization formula

Concluding Remark

- Discovering spatial/temporal patterns from 2D and 3D spatiotemporal systems with unsupervised learning:
 - Time-varying system assumption
 - Tensor factorization formula
