Definition, Properties, and Derivatives of Matrix Traces

A Class for Undergraduate Students

@Southern University of Science and Technology

Xinyu Chen

March 31, 2023

Class Targets

Throughout this class, you will:

- Understanding some basic concepts and connect them with linear algebra and machine learning
- Using matrix norms and traces in matrix computations (very useful!)

Vector & Matrix

Notation:

Basics

•00000

ullet On the vector $oldsymbol{x} \in \mathbb{R}^n$ of length n

$$m{x} = (x_1, x_2, \cdots, x_n)^{ op}$$
 or $m{x} = egin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix}$

• On the matrix $X \in \mathbb{R}^{m \times n}$ with m rows and n columns

$$m{X} = egin{bmatrix} x_{11} & x_{12} & \cdots & x_{1n} \ x_{21} & x_{22} & \cdots & x_{2n} \ dots & dots & dots & dots \ x_{m1} & x_{m2} & \cdots & x_{mn} \end{bmatrix}$$

000000

Vector Norms

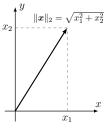

A number of concepts to mention, e.g., ℓ_0 -norm, ℓ_1 -norm, and ℓ_2 -norm.

• **Definition.** For any vector $\mathbf{x} \in \mathbb{R}^n$, the ℓ_2 -norm of \mathbf{x} is given by

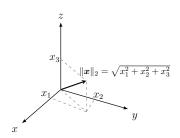

$$\|\boldsymbol{x}\|_{2} = \sqrt{x_{1}^{2} + x_{2}^{2} + \dots + x_{n}^{2}} = \sqrt{\sum_{i=1}^{n} x_{i}^{2}}$$

where $x_i, \forall i \in [n]$ is the *i*-th entry of x.

• Intuitive examples:

On
$$\boldsymbol{x} = (x_1, x_2)^{\top}$$

On
$$\mathbf{x} = (x_1, x_2, x_3)^{\top}$$

Summary

Inner Product

• Basics: For any $\boldsymbol{x}=(x_1,x_2)^{\top}$ and $\boldsymbol{y}=(y_1,y_2)^{\top}$, the angle θ can be computed by

$$\cos \theta = \frac{x_1 y_1 + x_2 y_2}{\sqrt{x_1^2 + x_2^2} \sqrt{y_1^2 + y_2^2}}$$

- in which
 - \circ ℓ_2 -norm:

$$\|\boldsymbol{x}\|_2 = \sqrt{x_1^2 + x_2^2}$$
 $\|\boldsymbol{y}\|_2 = \sqrt{y_1^2 + y_2^2}$

o inner product:

$$\langle \boldsymbol{x}, \boldsymbol{y} \rangle = x_1 y_1 + x_2 y_2$$

Inner Product

Derivatives

Definition. For any vectors $x, y \in \mathbb{R}^n$, the inner product is given by

$$\langle \boldsymbol{x}, \boldsymbol{y} \rangle = \boldsymbol{x}^{\top} \boldsymbol{y} = \sum_{i=1}^{n} x_i y_i$$

For any matrices $X, Y \in \mathbb{R}^{m \times n}$, the inner product is

$$\langle \boldsymbol{X}, \boldsymbol{Y} \rangle = \sum_{i=1}^{m} \sum_{j=1}^{n} x_{ij} y_{ij}$$

Example. Given $\boldsymbol{x} = (1, 2, 3, 4)^{\top}$ and $\boldsymbol{y} = (2, -1, 3, 0)^{\top}$, write down the inner product $\langle x, y \rangle$.

In this case,

$$\mathbf{x}^{\top}\mathbf{y} = 1 \times 2 + 2 \times (-1) + 3 \times 3 + 4 \times 0 = 9$$

000000

Frobenius Norm

• **Definition.** For any matrix $X \in \mathbb{R}^{m \times n}$, the Frobenius norm of X is given by

$$\|X\|_F = \sqrt{\sum_{i=1}^m \sum_{j=1}^n x_{ij}^2}$$

where $x_{ij}, \forall i \in [m], j \in [n]$ is the (i, j)-th entry of X.

Example. Given $X = \begin{bmatrix} 2 & 1 & 1 \\ 1 & 2 & 1 \\ 0 & 0 & 3 \end{bmatrix}$, write down the Frobenius norm of X.

$$\|\boldsymbol{X}\|_F = \sqrt{2^2 + 1^2 + 1^2 + 1^2 + 2^2 + 1^2 + 3^2} = \sqrt{21}$$

Frobenius Norm

• Connection with ℓ_2 -norm:

$$\|m{X}\|_F = \sqrt{\sum_{j=1}^n \sum_{i=1}^m x_{ij}^2} = \sqrt{\sum_{j=1}^n \|m{x}_j\|_2^2}$$

with the column vectors $\boldsymbol{x}_j \in \mathbb{R}^m, \, j \in [n]$ such that

$$oldsymbol{X} = egin{bmatrix} ert & ert & ert \ oldsymbol{x}_1 & oldsymbol{x}_2 & \cdots & oldsymbol{x}_n \ ert & ert & ert & ert \end{bmatrix} \in \mathbb{R}^{m imes n}$$

Definition of Matrix Trace

• **Definition.** For any square matrix $X \in \mathbb{R}^{n \times n}$, the matrix trace (denoted by $\operatorname{tr}(\cdot)$) is the sum of diagonal entries, i.e.,

$$\operatorname{tr}(\boldsymbol{X}) = \sum_{i=1}^{n} x_{ii}$$

where $x_{ii}, \forall i \in [n]$ is the (i, i)-th entry of \boldsymbol{X} . Thus, $\operatorname{tr}(\boldsymbol{X}) = \operatorname{tr}(\boldsymbol{X}^{\top})$.

Example. Given $X = \begin{bmatrix} 2 & 1 & 1 \\ 1 & 2 & 1 \\ 0 & 0 & 3 \end{bmatrix}$, write down the matrix trace of X.

$$tr(X) = 2 + 2 + 3 = 7$$

Summary

Property:
$$tr(X + Y) = tr(X) + tr(Y)$$

ullet Property. For any square matrices $m{X}, m{Y} \in \mathbb{R}^{n imes n}$, it always holds that $\mathrm{tr}(m{X} + m{Y}) = \mathrm{tr}(m{X}) + \mathrm{tr}(m{Y})$

Example. Given
$$X = \begin{bmatrix} 2 & 1 & 1 \\ 1 & 2 & 1 \\ 0 & 0 & 3 \end{bmatrix}$$
 and $Y = \begin{bmatrix} 2 & -1 & 0 \\ -1 & 2 & -1 \\ 0 & -1 & 2 \end{bmatrix}$, write down $\operatorname{tr}(X + Y)$.

In this case,

$$\mathbf{X} + \mathbf{Y} = \begin{bmatrix} 2+2 & 1-1 & 1+0 \\ 1-1 & 2+2 & 1-1 \\ 0+0 & 0-1 & 3+2 \end{bmatrix} = \begin{bmatrix} 4 & 0 & 1 \\ 0 & 4 & 0 \\ 0 & -1 & 5 \end{bmatrix}$$

Thus, tr(X + Y) = 4 + 4 + 5 = 13. Note that tr(X) = 7 and tr(Y) = 6, it shows that tr(X + Y) = tr(X) + tr(Y) = 13.

• Variant. For any $\alpha, \beta \in \mathbb{R}$, we have

$$\operatorname{tr}(\alpha \boldsymbol{X} + \beta \boldsymbol{Y}) = \alpha \operatorname{tr}(\boldsymbol{X}) + \beta \operatorname{tr}(\boldsymbol{Y})$$

Property: tr(XY) = tr(YX)

• Property. For any matrices $X \in \mathbb{R}^{m \times n}$ and $Y \in \mathbb{R}^{n \times m}$, it always holds that

$$\operatorname{tr}(\boldsymbol{X}\boldsymbol{Y}) = \operatorname{tr}(\boldsymbol{Y}\boldsymbol{X})$$

Proof.

Basics

$$\operatorname{tr}(\boldsymbol{X}\boldsymbol{Y}) = (\boldsymbol{X}\boldsymbol{Y})_{11} + (\boldsymbol{X}\boldsymbol{Y})_{22} + \dots + (\boldsymbol{X}\boldsymbol{Y})_{mm}$$

$$= x_{11}y_{11} + x_{12}y_{21} + \dots + x_{1n}y_{n1}$$

$$+ x_{21}y_{12} + x_{22}y_{22} + \dots + x_{2n}y_{n2}$$

$$+ \dots + x_{m1}y_{1m} + x_{m2}y_{2m} + \dots + x_{mn}y_{nm}$$

$$= y_{11}x_{11} + y_{12}x_{21} + \dots + y_{1m}x_{m1}$$

$$+ y_{21}x_{12} + y_{22}x_{22} + \dots + y_{2m}x_{m2}$$

$$+ \dots + y_{n1}x_{1n} + \dots + y_{n2}x_{2n} + \dots + y_{nm}x_{mn}$$

$$= (\boldsymbol{Y}\boldsymbol{X})_{11} + (\boldsymbol{Y}\boldsymbol{X})_{22} + \dots + (\boldsymbol{Y}\boldsymbol{X})_{nn}$$

$$= \operatorname{tr}(\boldsymbol{Y}\boldsymbol{X})$$

Property: tr(XY) = tr(YX)

Example. Given
$$\boldsymbol{X} = \begin{bmatrix} 2 & 1 & 1 \\ 1 & 2 & 1 \\ 0 & 0 & 3 \end{bmatrix}$$
 and $\boldsymbol{Y} = \begin{bmatrix} 2 & -1 & 0 \\ -1 & 2 & -1 \\ 0 & -1 & 2 \end{bmatrix}$, write down $\operatorname{tr}(\boldsymbol{X}\boldsymbol{Y})$ and $\operatorname{tr}(\boldsymbol{Y}\boldsymbol{X})$, respectively.

In this case,

$$\mathbf{XY} = \begin{bmatrix} 3 & -1 & 1 \\ 0 & 2 & 0 \\ 0 & -3 & 6 \end{bmatrix} \qquad \mathbf{YX} = \begin{bmatrix} 3 & 0 & 1 \\ 0 & 3 & -2 \\ -1 & -2 & 5 \end{bmatrix}$$

Thus,

$$tr(XY) = 3 + 2 + 6 = 11$$
 $tr(YX) = 3 + 3 + 5 = 11$

Property: $\|\boldsymbol{X}\|_F^2 = \operatorname{tr}(\boldsymbol{X}^{\top}\boldsymbol{X})$

• **Property.** For any matrix $X \in \mathbb{R}^{m \times n}$, it always holds that

$$\|oldsymbol{X}\|_F^2 = \operatorname{tr}(oldsymbol{X}^ op oldsymbol{X})$$

• Proof.

Basics

$$\operatorname{tr}(\boldsymbol{X}^{\top}\boldsymbol{X}) = (\boldsymbol{X}^{\top}\boldsymbol{X})_{11} + (\boldsymbol{X}^{\top}\boldsymbol{X})_{22} + \dots + (\boldsymbol{X}^{\top}\boldsymbol{X})_{nn}$$

$$= x_{11}^{2} + x_{21}^{2} + \dots + x_{m1}^{2}$$

$$+ x_{12}^{2} + x_{22}^{2} + \dots + x_{m2}^{2}$$

$$+ \dots + x_{1n}^{2} + x_{2n}^{2} + \dots + x_{mn}^{2}$$

$$= \sum_{i=1}^{m} x_{i1}^{2} + \sum_{i=1}^{m} x_{i2}^{2} + \dots + \sum_{i=1}^{m} x_{in}^{2}$$

$$= \sum_{i=1}^{m} \sum_{j=1}^{n} x_{ij}^{2}$$

$$= \|\boldsymbol{X}\|_{F}^{2}$$

Property: $\langle \boldsymbol{X}, \boldsymbol{Y} \rangle = \operatorname{tr}(\boldsymbol{X}^{\top} \boldsymbol{Y})$

• **Property.** For any matrices $X, Y \in \mathbb{R}^{m \times n}$, it always holds that

$$\langle \boldsymbol{X}, \boldsymbol{Y} \rangle = \operatorname{tr}(\boldsymbol{X}^{\top} \boldsymbol{Y})$$

Proof.

Basics

$$\operatorname{tr}(\boldsymbol{X}^{\top}\boldsymbol{Y}) = (\boldsymbol{X}^{\top}\boldsymbol{Y})_{11} + (\boldsymbol{X}^{\top}\boldsymbol{Y})_{22} + \dots + (\boldsymbol{X}^{\top}\boldsymbol{Y})_{nn}$$

$$= x_{11}y_{11} + x_{21}y_{21} + \dots + x_{m1}y_{m1}$$

$$+ x_{12}y_{12} + x_{22}y_{22} + \dots + x_{m2}y_{m2}$$

$$+ \dots + x_{1n}y_{1n} + x_{2n}y_{2n} + \dots + x_{mn}y_{mn}$$

$$= \langle \boldsymbol{x}_1, \boldsymbol{y}_1 \rangle + \langle \boldsymbol{x}_2, \boldsymbol{y}_2 \rangle + \dots + \langle \boldsymbol{x}_n, \boldsymbol{y}_n \rangle$$

$$= \langle \boldsymbol{X}, \boldsymbol{Y} \rangle$$

where $x_i, y_i \in \mathbb{R}^m, \forall i \in [n]$ are the *i*-th column vectors of X and Y, respectively.

Derivatives

Orthogonal Procrustes Problem

• Orthogonal Procrustes problem:

For any $Q \in \mathbb{R}^{m \times r}$, $m \ge r$, the solution to

$$\min_{\mathbf{F}} \|\mathbf{F} - \mathbf{Q}\|_F^2$$
s. t.
$$\mathbf{F}^{\top} \mathbf{F} = \mathbf{I}_r$$

is

Basics

$$F := UV^{\top}$$

where

$$oldsymbol{Q} = oldsymbol{U} oldsymbol{\Sigma} oldsymbol{V}^{ op}$$

singular value decomposition

$$\|\boldsymbol{F} - \boldsymbol{Q}\|_F^2 = \operatorname{tr}(\boldsymbol{F}^\top \boldsymbol{F} - \boldsymbol{F}^\top \boldsymbol{Q} - \boldsymbol{Q}^\top \boldsymbol{F} + \underline{\boldsymbol{Q}}^\top \boldsymbol{Q}) = -2\operatorname{tr}(\boldsymbol{F}^\top \boldsymbol{Q}) + \operatorname{const.}$$

$$\Longrightarrow \!\! \boldsymbol{F} = : \underset{\boldsymbol{F}^{\top}\boldsymbol{F} = \boldsymbol{I}_r}{\arg\min} \ \|\boldsymbol{F} - \boldsymbol{Q}\|_F^2 = \underset{\boldsymbol{F}^{\top}\boldsymbol{F} = \boldsymbol{I}_r}{\arg\max} \ \operatorname{tr}(\boldsymbol{F}^{\top}\boldsymbol{Q})$$

A Quick Look

Content:

- Vector structure, ℓ_2 -norm
- Matrix structure, Frobenius norm
- Definition, properties, and derivatives of matrix trace (including a lot of examples)
