# The Relevance of *t*-Statistics for Small Sample Sizes

An Introductory Class to Higher Statistics

# Xinyu Chen

December 6, 2024

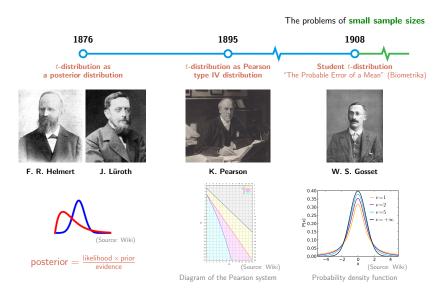

#### **Outline**

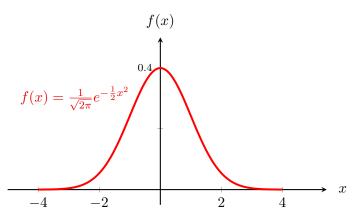

Answering a lot questions, e.g.,

- How was *t*-statistic developed?
- **②** Normal distribution vs. student *t*-distribution?
- What is *t*-statistic?
- **4** How to calcuate a *t*-test?
- **6** What are the hypotheses and the assumptions?
- **1** How to interpret results?

# Development

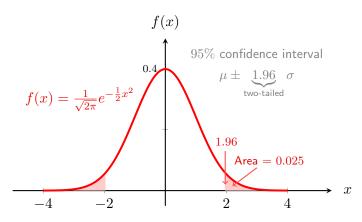

# **Revisiting Normal Distribution**

Probability density function of the standard normal distribution

# **Revisiting Normal Distribution**

Probability density function of the standard normal distribution

#### Implementing *z*-Test

#### Problem Statement

A company claims that the average daily energy consumption of households is 30 kWh with a population standard deviation of 5 kWh. A random sample of 40 households has an average daily energy consumption of 32 kWh. Conduct a two-tailed hypothesis test at a 95% confidence interval to determine if the sample provides sufficient evidence to reject the company's claim.

# Implementing z-Test

#### Problem Statement

A company claims that the average daily energy consumption of households is 30 kWh with a population standard deviation of 5 kWh. A random sample of 40 households has an average daily energy consumption of 32 kWh. Conduct a two-tailed hypothesis test at a 95% confidence interval to determine if the sample provides sufficient evidence to reject the company's claim.

#### Steps:

- Formulate Hypotheses
  - Null Hypothesis  $(H_0)$ : The population mean is  $\mu = 30 \, \text{kWh}$ .
  - Alternative Hypothesis ( $H_a$ ): The population mean is not  $\mu=30\,\mathrm{kWh}$  ( $\mu\neq30$ ).
- ② Use the *z*-test formula since the population standard deviation is known:

$$z = \frac{\bar{x} - \mu}{\sigma/\sqrt{n}} = \frac{32 - 30}{5/\sqrt{40}} = \frac{2}{5/6.32} = \frac{2}{0.79} \approx 2.53$$

- $\circ$   $\bar{x} = 32$  (sample mean)  $\circ$   $\mu = 30$  (population mean)
- $\circ$  n=40 (sample size)  $\circ$   $\sigma=5$  (population standard deviation)

# Implementing z-Test

#### Problem Statement

A company claims that the average daily energy consumption of households is 30 kWh with a population standard deviation of 5 kWh. A random sample of 40 households has an average daily energy consumption of 32 kWh. Conduct a two-tailed hypothesis test at a 95% confidence interval to determine if the sample provides sufficient evidence to reject the company's claim.

#### Steps:

**②** Use the z-test formula since the population standard deviation is known:

$$z = \frac{\bar{x} - \mu}{\sigma / \sqrt{n}} = \frac{32 - 30}{5 / \sqrt{40}} = \frac{2}{5 / 6.32} = \frac{2}{0.79} \approx 2.53$$

- $\bullet$  Decision rule at a 95% confidence interval
  - Reject  $H_0$  if |z| > 1.96.
  - $\circ$  Otherwise, fail to reject  $H_0$ .
- Interpretation
  - The test statistic |z| = 2.53 > 1.96 (exceeding the critical value).
  - o Thus, we reject the null hypothesis.
  - The sample provides sufficient evidence to conclude that the average daily energy consumption is not 30 kWh.

Probability density function:

$$f(x) = \frac{\Gamma(\frac{\nu+1}{2})}{\sqrt{\nu\pi}\Gamma(\frac{\nu}{2})} \left(1 + \frac{x^2}{\nu}\right)^{-\frac{\nu+1}{2}}$$

 $\circ \ x \in \mathbb{R}$ : The random variable  $\circ \ \nu \in \mathbb{Z}^+$ : Degrees of freedom

o  $\Gamma(\cdot)$ : The Gamma function

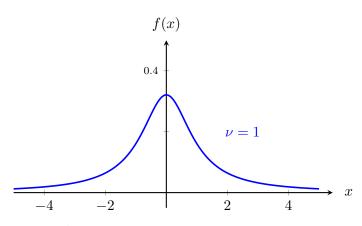

MARCH, 1908 BIOMETRIKA.

THE PROBABLE ERROR OF A MEAN.

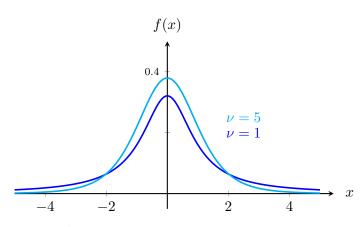

Any experiment may be regarded as farming an individual of a "population" of experiments which might be performed under the same conditions. A series of experiments is a sample drawn from this population. Now any series of experiments is only of value in so far as it enables us to form

a judgment as to the statistical constants of the population to which the experiof a mean, either directly, or as the mean difference between the two quantities. If the number of experiments he very large, we may have precise information

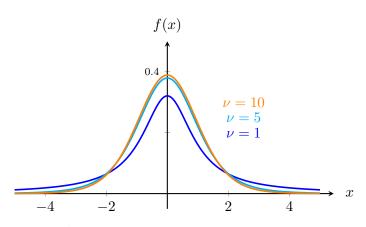

Gossset'1908 (known as "student")

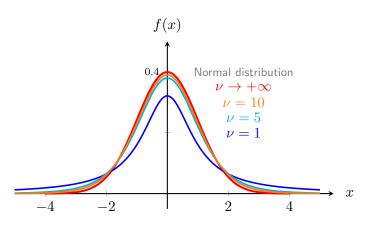

Student t-distribution of  $\nu$  degrees of freedom

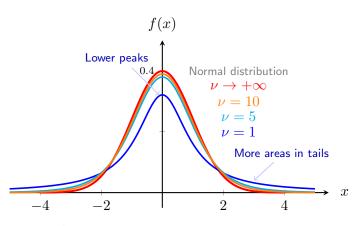

Student t-distribution of  $\nu$  degrees of freedom

Student t-distribution of  $\nu$  degrees of freedom

Student t-distribution of  $\nu$  degrees of freedom

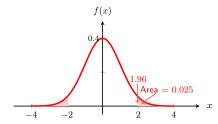

Student t-distribution of  $\nu$  degrees of freedom

#### 95% Confidence Interval

For the population mean  $\mu$  (given) and standard deviation  $\sigma$  (given or not?)

 If population standard deviation σ is known

$$\bar{x} \pm 1.96 imes \frac{\sigma}{\sqrt{n}}$$

Standard normal distribution

#### 95% Confidence Interval

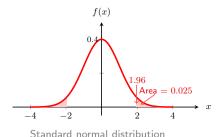

For the population mean  $\mu$  (given) and standard deviation  $\sigma$  (given or not?)

 If population standard deviation σ is known

$$\bar{x} \pm 1.96 \times \frac{\sigma}{\sqrt{n}}$$

 If σ is unknown, using sample standard deviation s instead

$$\bar{x} \pm ? \times \frac{s}{\sqrt{n}}$$

• Heavier tail in student t-distribution ( $\nu=n-1$  degrees of freedom) is important for small sample size n

#### Development

• Formula of *t*-statistic:

$$t = \frac{\bar{x} - \mu}{s / \sqrt{n}}$$

- $\circ \ \ \mu \ {\rm population} \ {\rm mean}$
- $\circ \ \ \bar{x} \ \, {\rm sample} \ \, {\rm mean}$
- $\circ\ s$  sample standard deviation
- $\circ$  n sample size (usually small value)
- The *t*-statistic quantifies the difference relative to variability in the data.
- (Interpretation) A high absolute value of t (larger than the critical value from the t-table) suggests a statistically significant difference.
- The problem of small sample size!

#### Implementing *t*-Test

#### Problem Statement

A company claims that the average daily energy consumption of households is 30 kWh. A random sample of 6 households has an average daily energy consumption of 32 kWh, with a sample standard deviation of 6 kWh. Conduct a two-tailed hypothesis test at a 95% confidence interval to determine if the sample provides sufficient evidence to reject the company's claim.

### Implementing t-Test

#### Problem Statement

A company claims that the average daily energy consumption of households is 30 kWh. A random sample of 6 households has an average daily energy consumption of 32 kWh, with a sample standard deviation of 6 kWh. Conduct a two-tailed hypothesis test at a 95% confidence interval to determine if the sample provides sufficient evidence to reject the company's claim.

#### Steps:

- Formulate Hypotheses
  - Null Hypothesis  $(H_0)$ : The population mean is  $\mu = 30 \, \text{kWh}$ .
  - o Alternative Hypothesis ( $H_a$ ): The population mean is not  $\mu=30\,\mathrm{kWh}$  ( $\mu\neq30$ ).
- Use the t-test formula since the population standard deviation is not known:

$$t = \frac{\bar{x} - \mu}{s/\sqrt{n}} = \frac{32 - 30}{6/\sqrt{6}} = \frac{2}{6/2.449} \approx 0.816$$

- o  $\bar{x} = 32$  (sample mean) o s = 6 (sample standard deviation)
- $\circ$  n=6 (sample size)  $\circ$   $\sigma=30$  (population mean)

#### *t*-Table

#### Small sample sizes

• Degrees of freedom for a *t*-test:

$$\nu = \underbrace{n}_{\text{sample size}} -1 = 6 - 1 = 5$$

• t-distributions with  $\nu$  degrees of freedom at a 95% confidence interval (two-tailed)

$\nu = 1$	$\nu = 5$	$\nu = 10$	$\nu \to +\infty$
12.706	2.571	2.228	1.960

• The critical t-value

$$t_{\nu,(1-0.95)/2} = t_{5,0.025} = 2.571$$

### Implementing t-Test

#### Problem Statement

A company claims that the average daily energy consumption of households is 30 kWh. A random sample of 6 households has an average daily energy consumption of 32 kWh, with a sample standard deviation of 6 kWh. Conduct a two-tailed hypothesis test at a 95% confidence interval to determine if the sample provides sufficient evidence to reject the company's claim.

#### Steps:

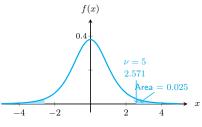

**②** Use the *t*-test formula:

$$t = \frac{\bar{x} - \mu}{s/\sqrt{n}} = \frac{32 - 30}{6/\sqrt{6}} = \frac{2}{6/2.449} \approx 0.816$$

- **3** Decision rule at a 95% confidence interval
  - Reject  $H_0$  if |t| > 2.571.
  - o Otherwise, fail to reject  $H_0$ .
- 4 Interpretation
  - The test statistic |t| = 0.816 < 2.571.
  - o Thus, we fail to reject the null hypothesis.
  - $\circ~$  There is not enough evidence to conclude that the average daily energy consumption differs from the company's claim of  $30~{\rm kWh}.$

#### Summary

• Student t-distribution of  $\nu$  degrees of freedom

Student t-distribution

- Population: mean  $\mu$  ( $\checkmark$ ), standard deviation  $\sigma$  (X)
- Sample: mean  $\bar{x}$ , standard deviation s, and small sample size n
- t-statistic:  $t = \frac{\bar{x} \mu}{s/\sqrt{n}} \Rightarrow t$ -test
- 95% confidence interval:  $\bar{x} \pm \underbrace{t_{\nu,0.025} \times \frac{s}{\sqrt{n}}}_{\nu=n-1}$
