### Outline

#### Content:

- How was t-statistic developed?
- **②** Normal distribution vs. student *t*-distribution?
- What is *t*-statistic?
- **4** How to calcuate a *t*-test?
- **6** What are the hypotheses and the assumptions?
- **6** How to interpret results?

### A Fascinating Blend of Statistics & Industrial History

"The Guinness Brewery faced the problem of ensuring consistent quality in their beer. To achieve this, they needed to analyze small sample sizes of ingredients and processes, as it was impractical and wasteful to test entire batches. This required innovative statistical techniques to infer population parameters (e.g., the mean) from small samples."

### BIOMETRIKA.

THE PROBABLE ERROR OF A MEAN.

BY STUDENT.

#### Introduction

Any experiment may be regarded as forming an individual of a "population" of experiments which might be performed under the same conditions. A series of experiments is a sample drawn from this population.

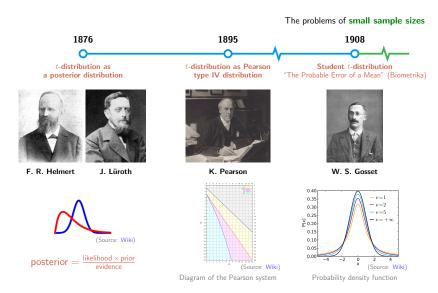

Now any series of experiments is only of value in so far as it enables us to form a judgment as to the statistical constants of the population to which the experiments belong. In a great number of cases the question finally turns on the value of a mean, either directly, or as the mean difference between the two quantities.

If the number of experiments be very large, we may have precise information

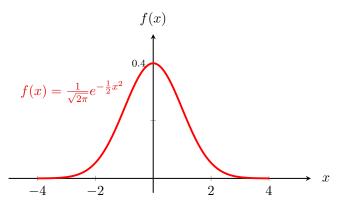

Gossset'1908 (known as "Student" due to industrial secrets)

### Development

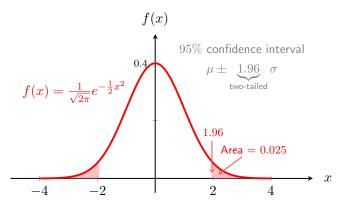

### **Revisiting Normal Distribution**

Probability density function of the standard normal distribution

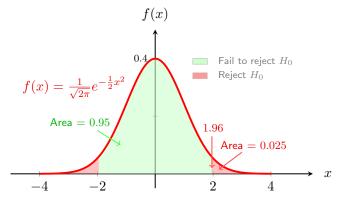

### **Revisiting Normal Distribution**

Probability density function of the standard normal distribution

### **Connecting with Hypothesis Test**

- Hypothesis test
  - o Population: mean  $\mu$ , standard deviation  $\sigma$
  - o Sample: mean  $\bar{x}$ , sample size n
  - $\circ$  Null hypothesis  $(H_0)$ : The population mean is  $\mu$
  - o z-statistic:  $z=\frac{\dot{x}-\mu}{\sigma/\sqrt{n}}$  ( $z\uparrow$  implies statistically significant difference)
- 95% confidence interval

### Implementing z-Test

#### Problem Statement

A company claims that the average daily energy consumption of households is 30 kWh with a population standard deviation of 5 kWh. A random sample of 40 households has an average daily energy consumption of 32 kWh. Conduct a two-tailed hypothesis test at a 95% confidence interval to determine if the sample provides sufficient evidence to reject the company's claim.

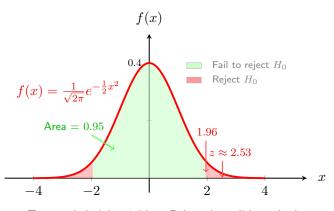

- $\circ \ \, \bar{x}=32 \ \hbox{(sample mean)} \qquad \circ \ \, \mu=30 \ \hbox{(population mean)}$
- $\circ \ n=40$  (sample size)  $\circ \ \sigma=5$  (population standard deviation)

### Steps:

• Formulate Hypotheses

- Null Hypothesis  $(H_0)$ : The population mean is  $\mu = 30 \, \text{kWh}$ .
- Alternative Hypothesis ( $H_a$ ): The population mean is  $\mu \neq 30$  kWh.
- **②** Use the *z*-test formula since the population standard deviation is known:

$$z = \frac{\bar{x} - \mu}{\sigma / \sqrt{n}} = \frac{32 - 30}{5 / \sqrt{40}} = \frac{2}{5 / 6.32} = \frac{2}{0.79} \approx 2.53$$

Test statistic  $|z|>1.96\Rightarrow$  Reject the null hypothesis

### Student *t*-Distribution

In the case of small sample sizes?

- Switch to student t-distribution and t-test
- Probability density function:

$$f(x) = \frac{\Gamma(\frac{\nu+1}{2})}{\sqrt{\nu\pi}\Gamma(\frac{\nu}{2})} \left(1 + \frac{x^2}{\nu}\right)^{-\frac{\nu+1}{2}}$$

 $\circ \ x \in \mathbb{R}$ : random variable

 $\circ \ \nu \in \mathbb{Z}^+$ : degrees of freedom

o  $\Gamma(\cdot)$ : Gamma function

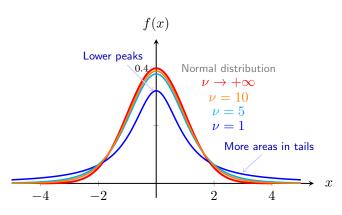

### Student *t*-Distribution

Student t-distribution of  $\nu$  degrees of freedom

### Student *t*-Distribution

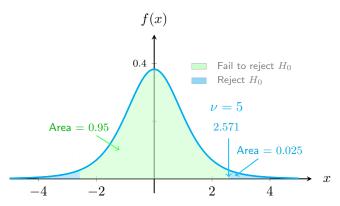

Student t-distribution of  $\nu$  degrees of freedom

#### **Definition of** *t*-**Statistic**

Formula of t-statistic for small sample sizes

$$t = \frac{\bar{x} - \mu}{s / \sqrt{n}}$$

- $\circ$  Population: mean  $\mu$
- Sample: mean  $\bar{x}$ , standard deviation s, sample size n (small value)
- A high absolute value of t suggests a statistically significant difference.

### Implementing *t*-Test for Small Sample Size

#### **Problem Statement**

A company claims that the average daily energy consumption of households is  $30\ kWh$ . A random sample of  $6\ households$  has an average daily energy consumption of  $32\ kWh$ , with a sample standard deviation of  $4\ kWh$ . Conduct a two-tailed hypothesis test at a 95% confidence interval to determine if the sample provides sufficient evidence to reject the company's claim.

 $\circ$   $\bar{x}=32$  (sample mean)  $\circ$  s=4 (sample standard deviation)  $\circ$  n=6 (sample size)  $\circ$   $\mu=30$  (population mean)

### Steps:

- Formulate Hypotheses
  - Null Hypothesis ( $H_0$ ): The population mean is  $\mu = 30 \, \text{kWh}$ .
  - Alternative Hypothesis ( $H_a$ ): The population mean is  $\mu \neq 30$  kWh.
- Use the t-test formula since the population standard deviation is not known:

$$t = \frac{\bar{x} - \mu}{s/\sqrt{n}} = \frac{32 - 30}{4/\sqrt{6}} = \frac{2}{4/2.449} \approx 1.22$$

### Critical Values in t-Table

#### Small sample sizes

• Degrees of freedom for a *t*-test:

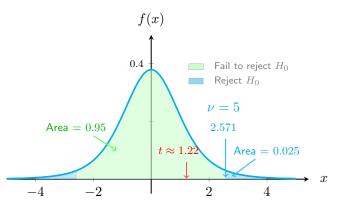

$$\nu = \underbrace{n}_{\text{sample size}} -1 = 6 - 1 = 5$$

• t-distributions with  $\nu$  degrees of freedom at a 95% confidence interval (two-tailed)

$\nu = 1$	$\nu = 5$	$\nu = 10$	$\nu \to +\infty$
12.706	2.571	2.228	1.960

The critical t-value

$$t_{\nu,(1-0.95)/2} = t_{5,0.025} = 2.571$$

Test statistic  $|t| < 2.571 \Rightarrow$  Fail to reject the null hypothesis

### Implementing *t*-Test for Small Sample Size

#### Problem Statement

A company claims that the average daily energy consumption of households is  $30\ kWh$ . A random sample of  $6\ households$  has an average daily energy consumption of  $32\ kWh$ , with a sample standard deviation of  $6\ kWh$ . Conduct a two-tailed hypothesis test at a 95% confidence interval to determine if the sample provides sufficient evidence to reject the company's claim.

#### Steps:

2 Use the *t*-test formula:

$$t = \frac{\bar{x} - \mu}{s/\sqrt{n}} = \frac{32 - 30}{6/\sqrt{6}} = \frac{2}{6/2.449} \approx 1.22$$

- **3** Decision rule at a 95% confidence interval
  - Reject  $H_0$  if |t| > 2.571.
  - o Otherwise, fail to reject  $H_0$ .
- 4 Interpretation
  - The test statistic |t| = 1.22 < 2.571.
  - Thus, we fail to reject the null hypothesis.
  - There is not enough evidence to conclude that the average daily energy consumption differs from the company's claim of 30 kWh.

### Normal Distribution vs. Student *t*-Distribution?

For the population mean  $\mu$  ( $\checkmark$ ) and standard deviation  $\sigma$  ( $\checkmark$ /X)

 If population standard deviation σ is known

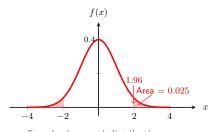

$$\bar{x} \pm 1.96 \times \frac{\sigma}{\sqrt{n}}$$

• Use z-test

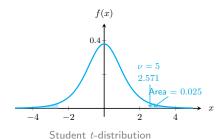

• If  $\sigma$  is unknown, using sample standard deviation s instead

$$\bar{x} \pm ? \times \frac{s}{\sqrt{n}}$$

• Use *t*-test

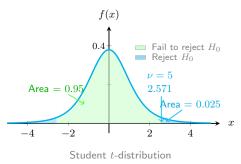

Standard normal distribution

• Heavy tail in student t-distribution ( $\nu=n-1$  degrees of freedom) is important for small sample size n

### Summary

• Student t-distribution of  $\nu$  degrees of freedom

W. S. Gosset in Guinness (Source: link)

• Population: mean  $\mu$  ( $\checkmark$ ), standard deviation  $\sigma$  (X)

 $\bullet$  Sample: mean  $\bar{x},$  standard deviation s, and small sample size n

• What is hypothesis test? 
$$95\%$$
 confidence interval:  $\bar{x}\pm\underbrace{t_{\nu,0.025}}_{\nu=n-1}\times\frac{s}{\sqrt{n}}$ 

• What is t-statistic? How to calculate t-test?  $t=\frac{\bar{x}-\mu}{s/\sqrt{n}}$ 

# Thank you!
