

Visualizing the Geometry of Optimization: A Tutorial

Xinyu Chen

Assistant Professor

University of Central Florida

May 18, 2026

Outline:

- Linear programming
- Quadratic programming
- Geometry of quadratic function
- Mixed-integer quadratic programming

Linear Programming

Optimization problem:

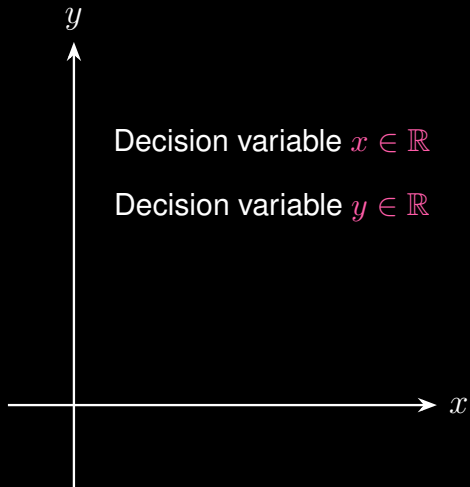

$$\max_{x \in \mathbb{R}, y \in \mathbb{R}} \quad 4x + y$$

$$\text{s.t.} \quad x, y \geq 0$$

$$3x + 2y \leq 18$$

$$-x + 2y \geq 2$$

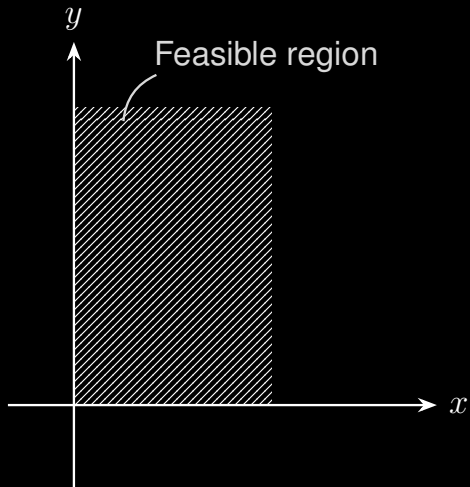

$$x \leq 3$$

Linear Programming

Optimization problem:

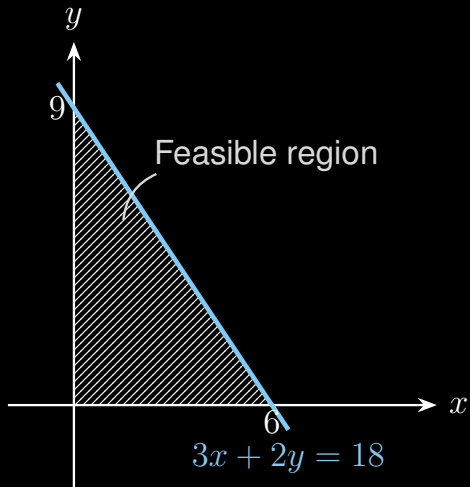

$$\begin{array}{ll}\max_{x \in \mathbb{R}, y \in \mathbb{R}} & 4x + y \\ \text{s.t.} & x, y \geq 0\end{array}$$

Linear Programming

Optimization problem:

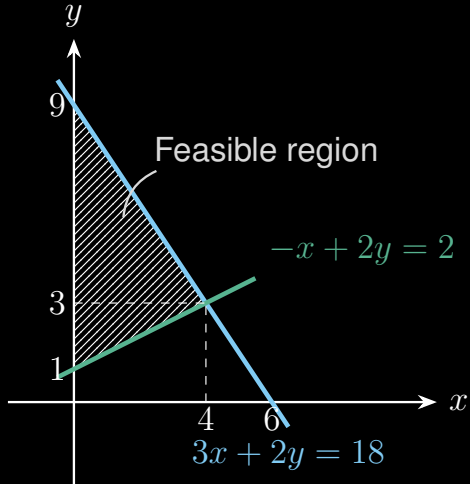

$$\begin{array}{ll}\max_{x \in \mathbb{R}, y \in \mathbb{R}} & 4x + y \\ \text{s.t.} & x, y \geq 0 \\ & 3x + 2y \leq 18\end{array}$$

Linear Programming

Optimization problem:

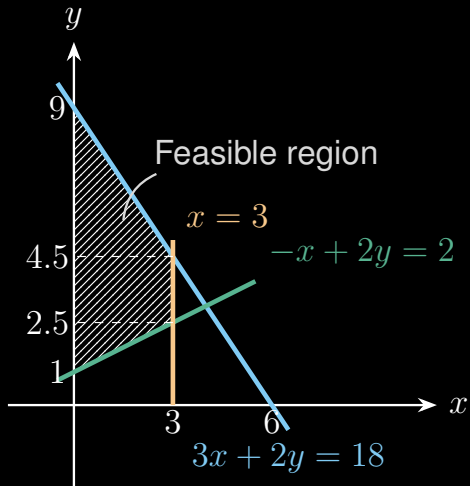

$$\begin{array}{ll}\max_{x \in \mathbb{R}, y \in \mathbb{R}} & 4x + y \\ \text{s.t.} & x, y \geq 0 \\ & 3x + 2y \leq 18 \\ & -x + 2y \geq 2\end{array}$$

Linear Programming

Optimization problem:

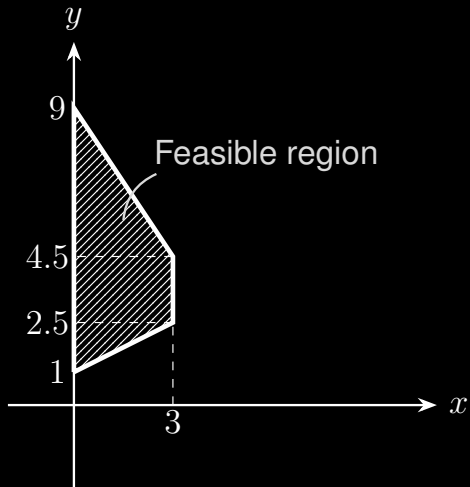

$$\begin{array}{ll}\max_{x \in \mathbb{R}, y \in \mathbb{R}} & 4x + y \\ \text{s.t.} & x, y \geq 0 \\ & 3x + 2y \leq 18 \\ & -x + 2y \geq 2 \\ & x \leq 3\end{array}$$

Linear Programming

Optimization problem:

$$\begin{array}{ll}\max_{x \in \mathbb{R}, y \in \mathbb{R}} & 4x + y \\ \text{s.t.} & x, y \geq 0 \\ & 3x + 2y \leq 18 \\ & -x + 2y \geq 2 \\ & x \leq 3\end{array}$$

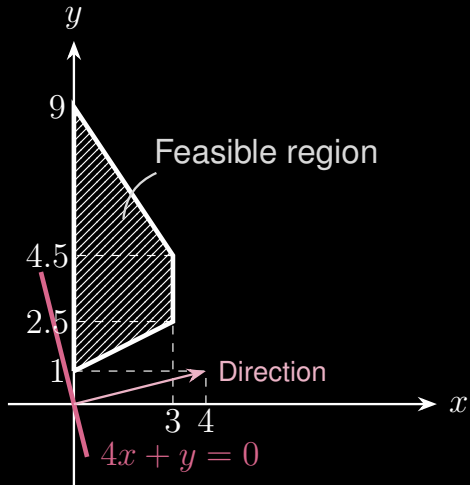

Linear Programming

Optimization problem:

$$\begin{array}{ll}\max_{x \in \mathbb{R}, y \in \mathbb{R}} & 4x + y \\ \text{s.t.} & x, y \geq 0 \\ & 3x + 2y \leq 18 \\ & -x + 2y \geq 2 \\ & x \leq 3\end{array}$$

Direction vector $(4, 1)$

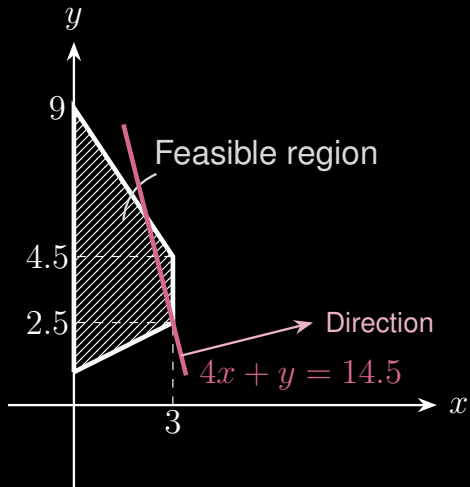

Linear Programming

Optimization problem:

$$\begin{array}{ll}\max_{x \in \mathbb{R}, y \in \mathbb{R}} & 4x + y \\ \text{s.t.} & x, y \geq 0 \\ & 3x + 2y \leq 18 \\ & -x + 2y \geq 2 \\ & x \leq 3\end{array}$$

Direction vector $(4, 1)$

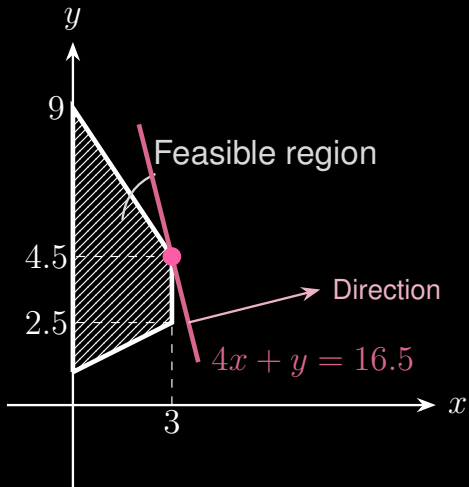

Linear Programming

Optimization problem:

$$\begin{array}{ll}\max_{x \in \mathbb{R}, y \in \mathbb{R}} & 4x + y \\ \text{s.t.} & x, y \geq 0 \\ & 3x + 2y \leq 18 \\ & -x + 2y \geq 2 \\ & x \leq 3\end{array}$$

Optimal solution: $x = 3, y = 4.5$

How about integer decision variables?

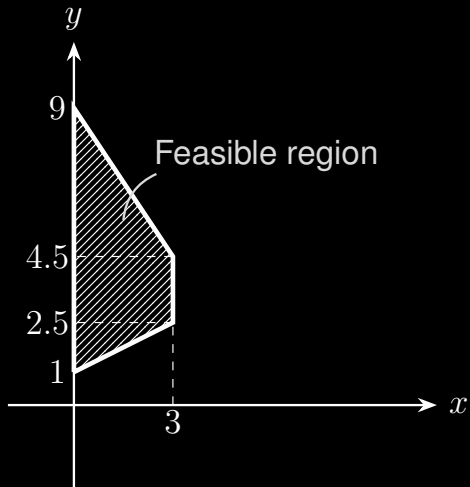

$$x \in \mathbb{Z} \text{ and } y \in \mathbb{Z}$$

Integer Linear Programming

Optimization problem:

$$\begin{array}{ll}\max_{x \in \mathbb{Z}, y \in \mathbb{Z}} & 4x + y \\ \text{s.t.} & x, y \geq 0 \\ & 3x + 2y \leq 18 \\ & -x + 2y \geq 2 \\ & x \leq 3\end{array}$$

Feasible solutions (●)

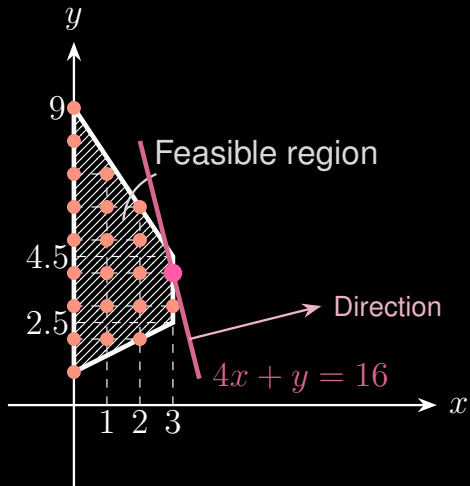

Integer Linear Programming

Optimization problem:

$$\begin{array}{ll}\max_{x \in \mathbb{Z}, y \in \mathbb{Z}} & 4x + y \\ \text{s.t.} & x, y \geq 0 \\ & 3x + 2y \leq 18 \\ & -x + 2y \geq 2 \\ & x \leq 3\end{array}$$

Feasible solutions (●)

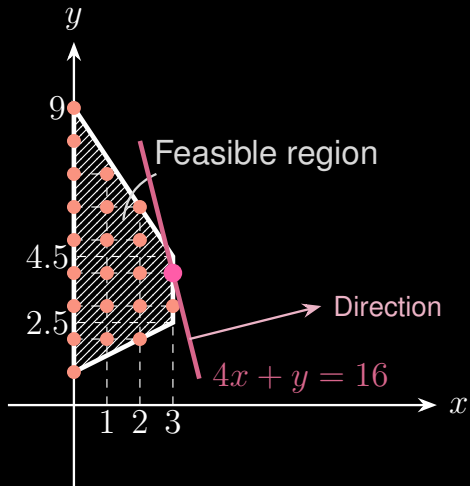

Integer Linear Programming

Optimization problem:

$$\begin{array}{ll}\max_{x \in \mathbb{Z}, y \in \mathbb{Z}} & 4x + y \\ \text{s.t.} & x, y \geq 0 \\ & 3x + 2y \leq 18 \\ & -x + 2y \geq 2 \\ & x \leq 3\end{array}$$

Optimal solution: $x = 3, y = 4$

How about integer decision variables?

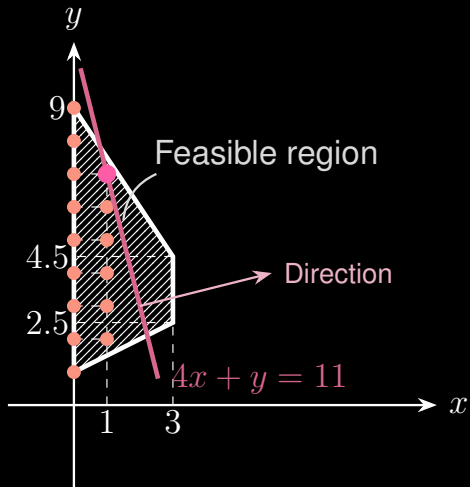

$$x \in \{0, 1\} \text{ and } y \in \mathbb{Z}$$

Integer Linear Programming

Optimization problem:

$$\begin{array}{ll}\max_{x \in \{0,1\}, y \in \mathbb{Z}} & 4x + y \\ \text{s.t.} & x, y \geq 0 \\ & 3x + 2y \leq 18 \\ & -x + 2y \geq 2 \\ & x \leq 3\end{array}$$

Feasible solutions (● $x = 0, 1$)

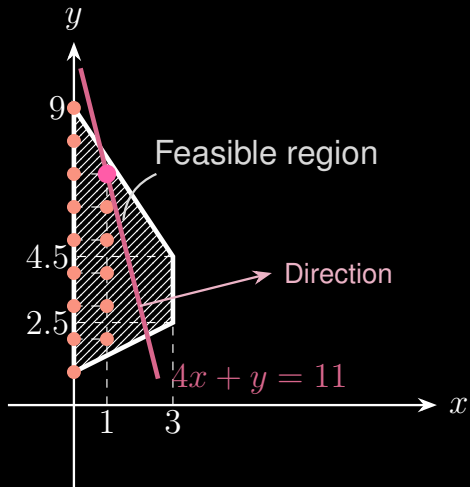

Integer Linear Programming

Optimization problem:

$$\begin{array}{ll}\max_{x \in \{0,1\}, y \in \mathbb{Z}} & 4x + y \\ \text{s.t.} & x, y \geq 0 \\ & 3x + 2y \leq 18 \\ & -x + 2y \geq 2 \\ & x \leq 3\end{array}$$

Optimal solution: $x = 1, y = 7$

How about mixed-integer decision variables?

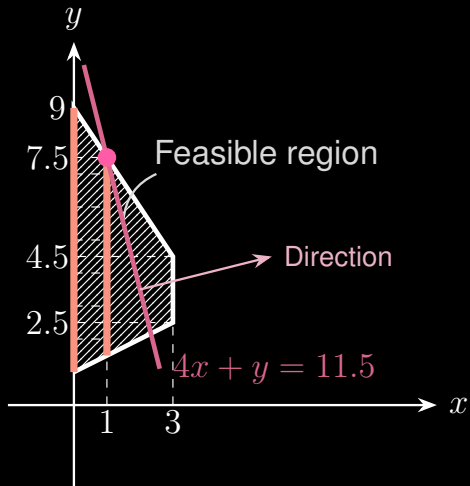

$$x \in \{0, 1\} \text{ and } y \in \mathbb{R}$$

Mixed-Integer Linear Programming

Optimization problem:

$$\begin{array}{ll}\max_{x \in \{0,1\}, y \in \mathbb{R}} & 4x + y \\ \text{s.t.} & x, y \geq 0 \\ & 3x + 2y \leq 18 \\ & -x + 2y \geq 2 \\ & x \leq 3\end{array}$$

Feasible solutions (—)

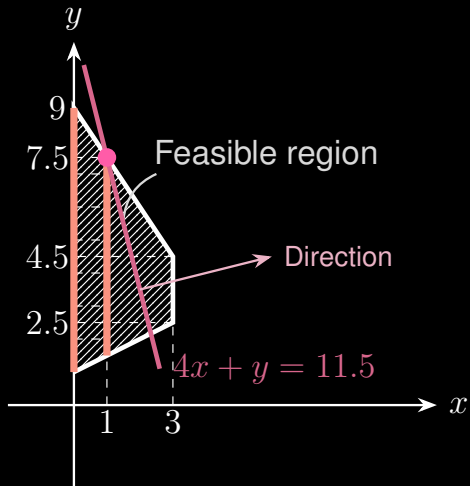

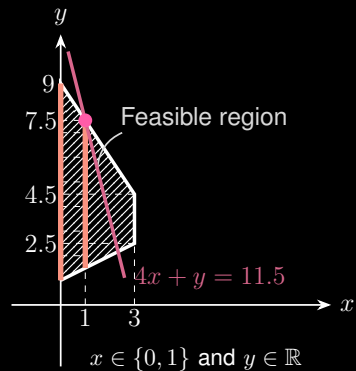

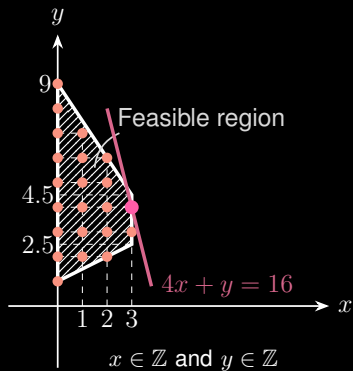

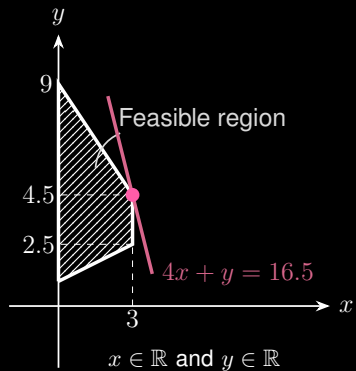

Mixed-Integer Linear Programming

Optimization problem:

$$\begin{array}{ll}\max_{x \in \{0,1\}, y \in \mathbb{R}} & 4x + y \\ \text{s.t.} & x, y \geq 0 \\ & 3x + 2y \leq 18 \\ & -x + 2y \geq 2 \\ & x \leq 3\end{array}$$

Optimal solution: $x = 1, y = 7.5$

Outline:

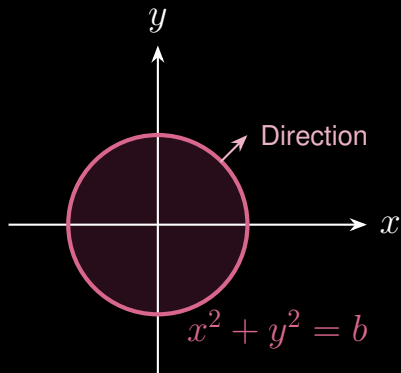

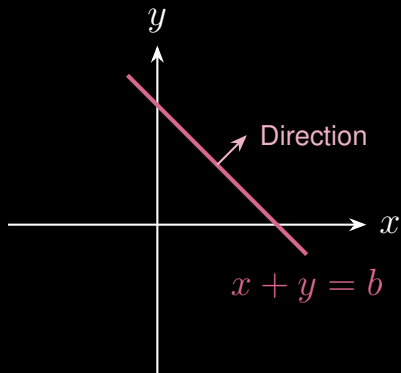

- ✓ Linear programming
- ✗ Quadratic programming
- ✗ Geometry of quadratic function
- ✗ Mixed-integer quadratic programming

How about quadratic objective function?

$$\max x + y$$

→

$$\max x^2 + y^2$$

Quadratic Programming

Optimization problem:

$$\max_{x \in \mathbb{R}, y \in \mathbb{R}} x^2 + y^2$$

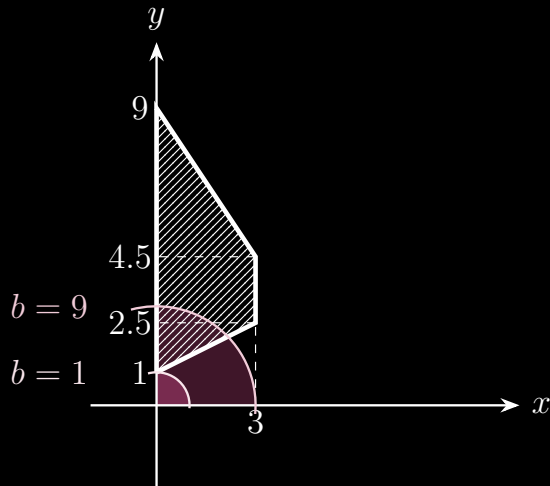

$$\text{s.t. } x, y \geq 0$$

$$3x + 2y \leq 18$$

$$-x + 2y \geq 2$$

$$x \leq 3$$

Objective function $x^2 + y^2 = b$

Quadratic Programming

Optimization problem:

$$\max_{x \in \mathbb{R}, y \in \mathbb{R}} x^2 + y^2$$

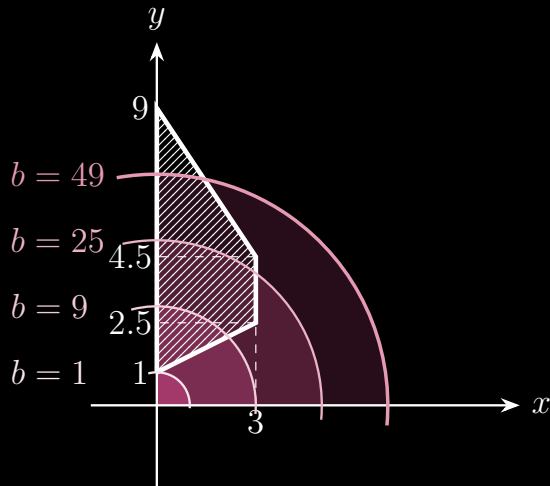

$$\text{s.t. } x, y \geq 0$$

$$3x + 2y \leq 18$$

$$-x + 2y \geq 2$$

$$x \leq 3$$

Objective function $x^2 + y^2 = b$

Quadratic Programming

Optimization problem:

$$\max_{x \in \mathbb{R}, y \in \mathbb{R}} x^2 + y^2$$

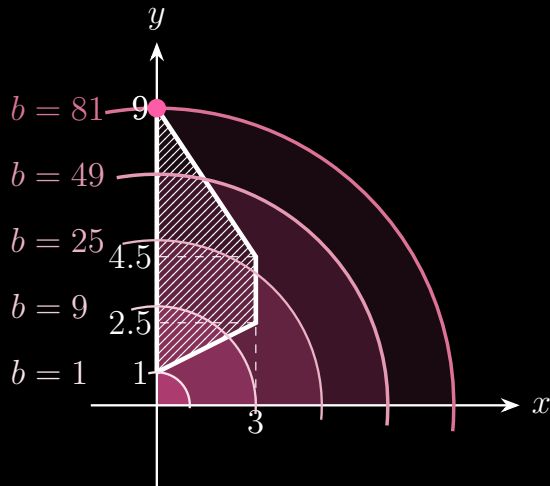

$$\text{s.t. } x, y \geq 0$$

$$3x + 2y \leq 18$$

$$-x + 2y \geq 2$$

$$x \leq 3$$

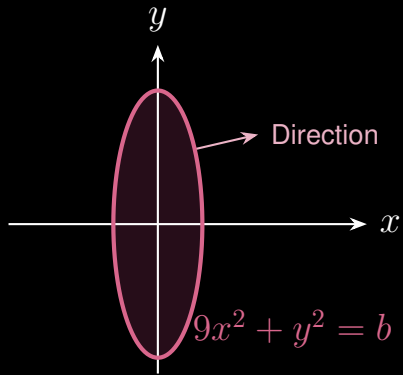

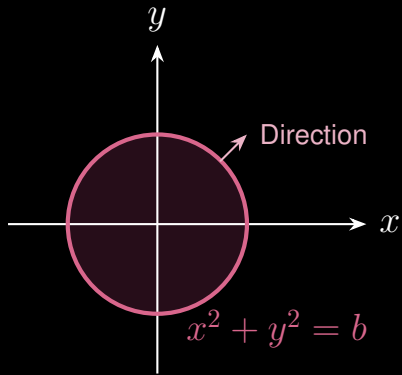

Optimal solution: $x = 0, y = 9$

$$\max x^2 + y^2$$

$\rightarrow$

$$\max 9x^2 + y^2$$

Quadratic Programming

Optimization problem:

$$\max_{x \in \mathbb{R}, y \in \mathbb{R}} \quad 9x^2 + y^2$$

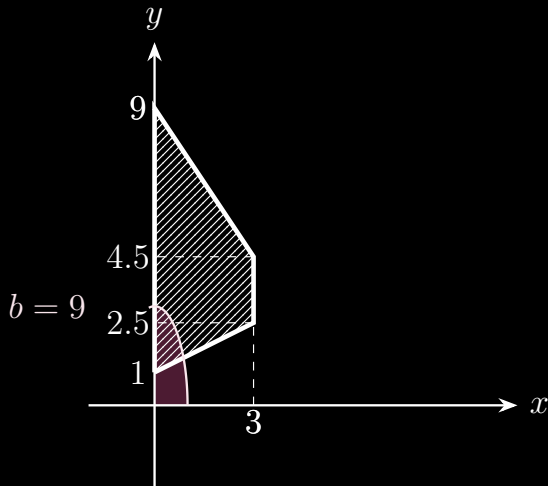

$$\text{s.t.} \quad x, y \geq 0$$

$$3x + 2y \leq 18$$

$$-x + 2y \geq 2$$

$$x \leq 3$$

Objective function $9x^2 + y^2 = b$

Quadratic Programming

Optimization problem:

$$\max_{x \in \mathbb{R}, y \in \mathbb{R}} \quad 9x^2 + y^2$$

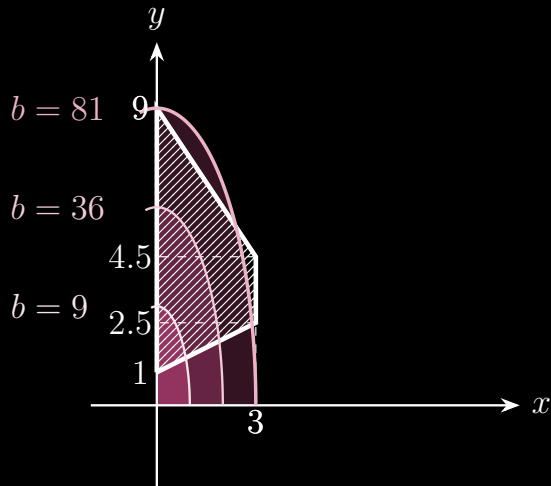

$$\text{s.t.} \quad x, y \geq 0$$

$$3x + 2y \leq 18$$

$$-x + 2y \geq 2$$

$$x \leq 3$$

Objective function $9x^2 + y^2 = b$

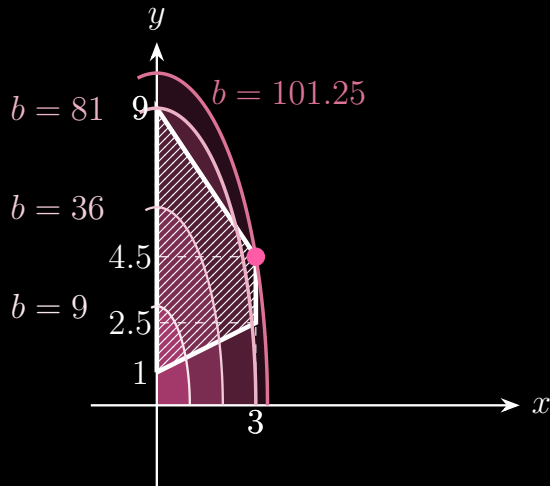

Quadratic Programming

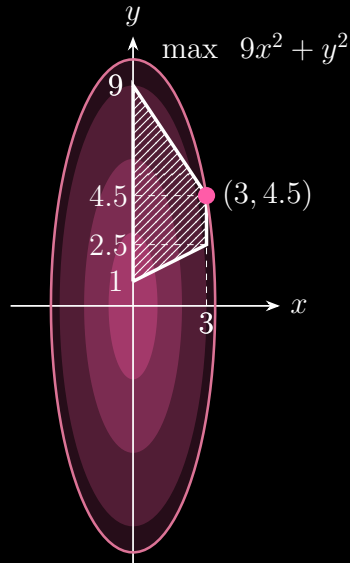

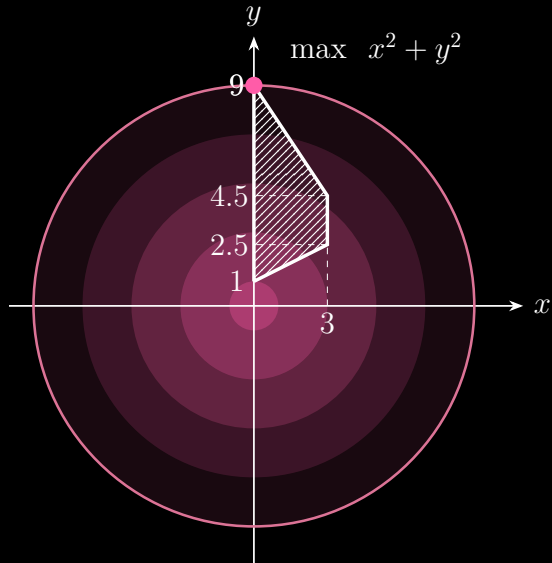

Optimization problem:

$$\begin{aligned} \max_{x \in \mathbb{R}, y \in \mathbb{R}} \quad & 9x^2 + y^2 \\ \text{s.t.} \quad & x, y \geq 0 \\ & 3x + 2y \leq 18 \\ & -x + 2y \geq 2 \\ & x \leq 3 \end{aligned}$$

Optimal solution: $x = 3, y = 4.5$

Different objectives $\rightarrow$ different optimal solutions

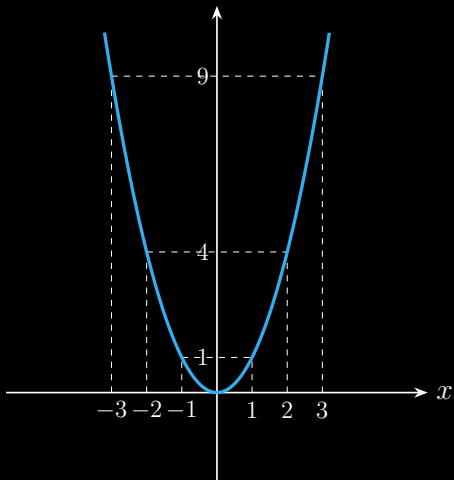

Outline:

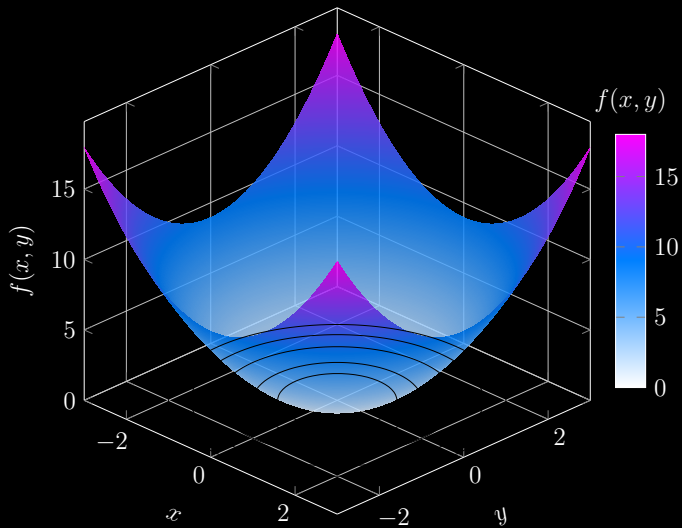

- ✓ Linear programming
- ✓ Quadratic programming
- ✗ Geometry of quadratic function
- ✗ Mixed-integer quadratic programming

Quadratic Function

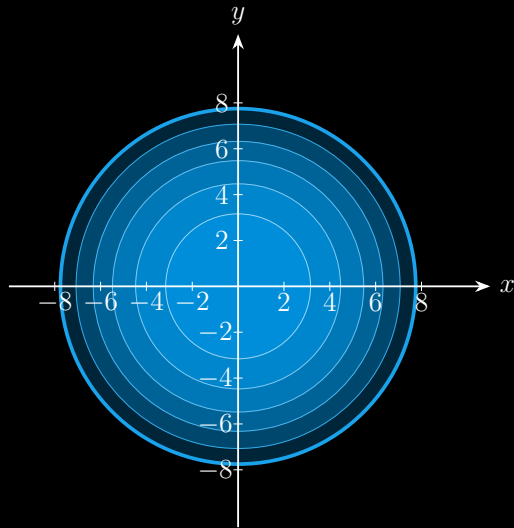

$$f(x) = x^2$$

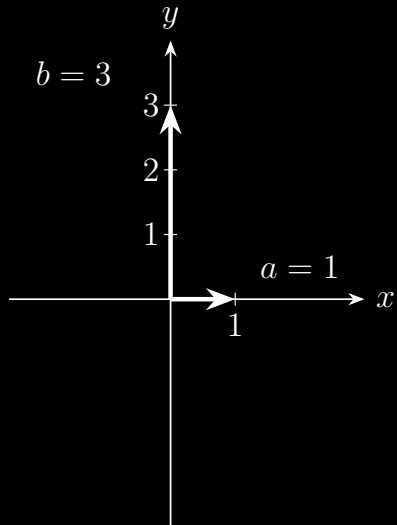

Quadratic Function $f(x, y) = x^2 + y^2$

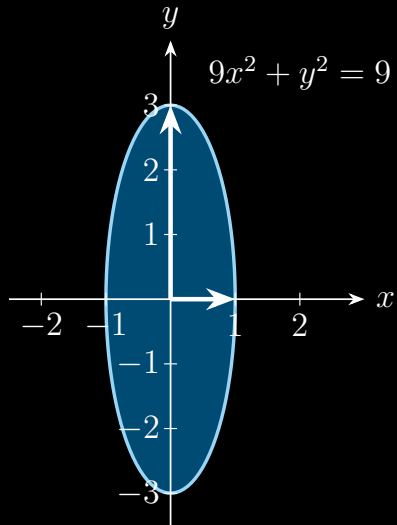

Quadratic Function $f(x, y) = x^2 + y^2$

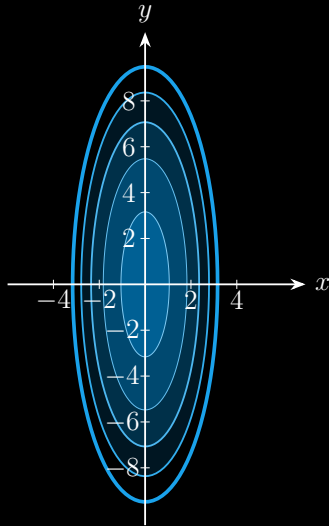

Ellipse: $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$

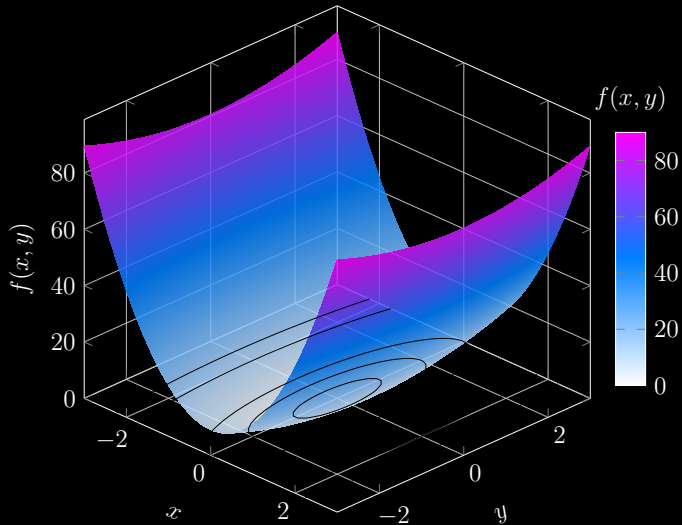

Quadratic Function $f(x, y) = 9x^2 + y^2$

Quadratic Function $f(x, y) = 9x^2 + y^2$

Quadratic Function

$$f(x, y) = 9x^2 + 4xy + y^2 = \begin{bmatrix} x \\ y \end{bmatrix}^T \underbrace{\begin{bmatrix} 9 & 2 \\ 2 & 1 \end{bmatrix}}_A \begin{bmatrix} x \\ y \end{bmatrix}$$

Eigenvalue decomposition:

$$A = \lambda_1 \mathbf{u}_1 \mathbf{u}_1^T + \lambda_2 \mathbf{u}_2 \mathbf{u}_2^T$$

with eigenvalues:

$$\lambda_1 = 9.47 \quad \lambda_2 = 0.53$$

and eigenvectors:

$$\mathbf{u}_1 = \begin{bmatrix} 0.97 \\ 0.23 \end{bmatrix} \quad \mathbf{u}_2 = \begin{bmatrix} -0.23 \\ 0.97 \end{bmatrix}$$

```
1 import numpy as np
2
3 A = np.array([[9, 2], [2, 1]])
4 eig_val, eig_vec = np.linalg.eig(A)
5
6 print('lambda_1 = ', eig_val[0])
7 print('lambda_2 = ', eig_val[1])
8 print('u_1 = ', eig_vec[:, 0])
9 print('u_2 = ', eig_vec[:, 1])
```

Quadratic Function

$$f(x, y) = 9x^2 + 4xy + y^2 = \underbrace{\begin{bmatrix} x \\ y \end{bmatrix}^\top}_{\mathbf{w}^\top} \underbrace{\begin{bmatrix} 9 & 2 \\ 2 & 1 \end{bmatrix}}_{\mathbf{A}} \underbrace{\begin{bmatrix} x \\ y \end{bmatrix}}_{\mathbf{w}}$$

Using the eigenvalue decomposition:

$$\begin{aligned} \mathbf{w}^\top \mathbf{A} \mathbf{w} &= \mathbf{w}^\top (\lambda_1 \mathbf{u}_1 \mathbf{u}_1^\top + \lambda_2 \mathbf{u}_2 \mathbf{u}_2^\top) \mathbf{w} \\ &= \lambda_1 (\mathbf{u}_1^\top \mathbf{w})^2 + \lambda_2 (\mathbf{u}_2^\top \mathbf{w})^2 \end{aligned}$$

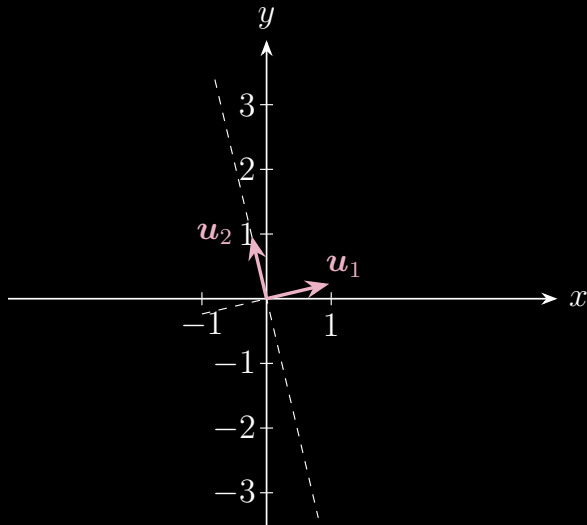

with eigenvalues and eigenvectors:

$$\lambda_1 = 9.47 \quad \mathbf{u}_1 = \begin{bmatrix} 0.97 \\ 0.23 \end{bmatrix} \quad \lambda_2 = 0.53 \quad \mathbf{u}_2 = \begin{bmatrix} -0.23 \\ 0.97 \end{bmatrix}$$

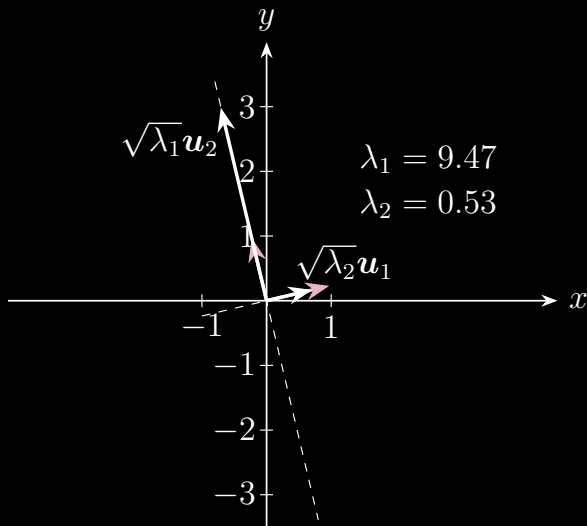

If $f(x, y) = \lambda_1 \lambda_2$, then the ellipse is

$$\lambda_1(\mathbf{u}_1^\top \mathbf{w})^2 + \lambda_2(\mathbf{u}_2^\top \mathbf{w})^2 = \lambda_1 \lambda_2 \quad \Rightarrow \quad \frac{(\mathbf{u}_1^\top \mathbf{w})^2}{(\sqrt{\lambda_2})^2} + \frac{(\mathbf{u}_2^\top \mathbf{w})^2}{(\sqrt{\lambda_1})^2} = 1$$

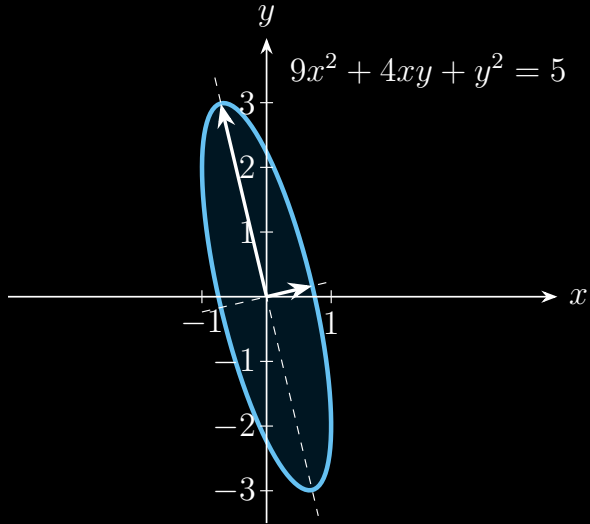

Ellipse $\frac{(\mathbf{u}_1^\top \mathbf{w})^2}{(\sqrt{\lambda_2})^2} + \frac{(\mathbf{u}_2^\top \mathbf{w})^2}{(\sqrt{\lambda_1})^2} = 1$

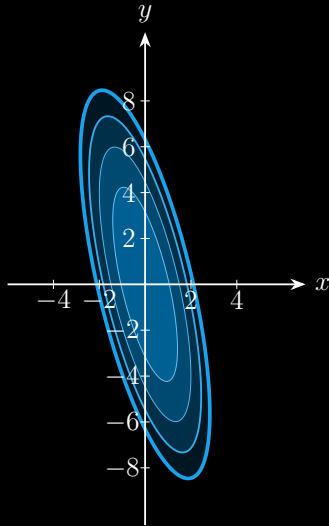

Ellipse $\frac{(\mathbf{u}_1^\top \mathbf{w})^2}{(\sqrt{\lambda_2})^2} + \frac{(\mathbf{u}_2^\top \mathbf{w})^2}{(\sqrt{\lambda_1})^2} = 1$

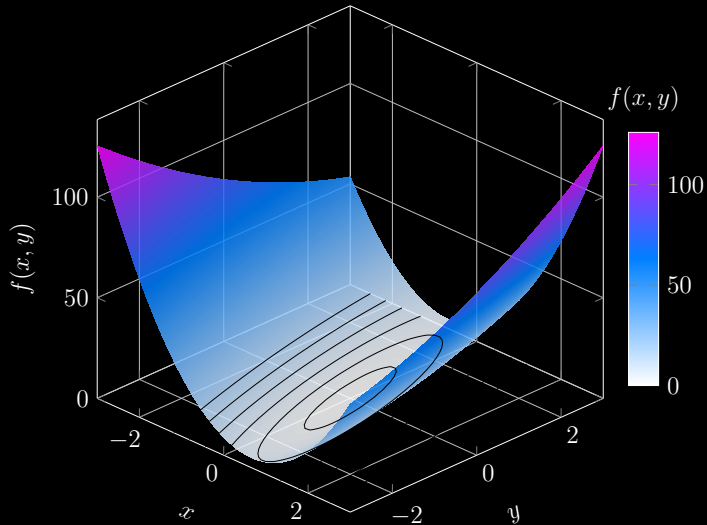

Ellipse $\frac{(\mathbf{u}_1^\top \mathbf{w})^2}{(\sqrt{\lambda_2})^2} + \frac{(\mathbf{u}_2^\top \mathbf{w})^2}{(\sqrt{\lambda_1})^2} = 1$

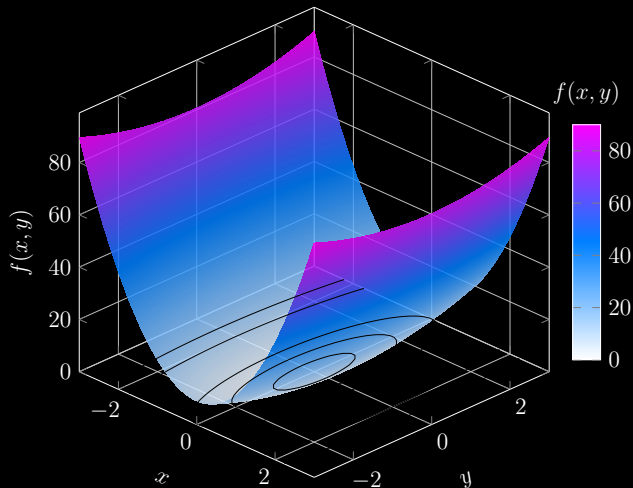

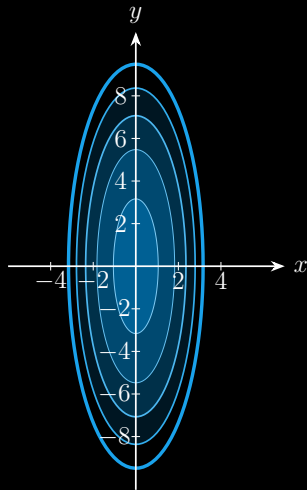

Quadratic Function $f(x, y) = 9x^2 + 4xy + y^2$

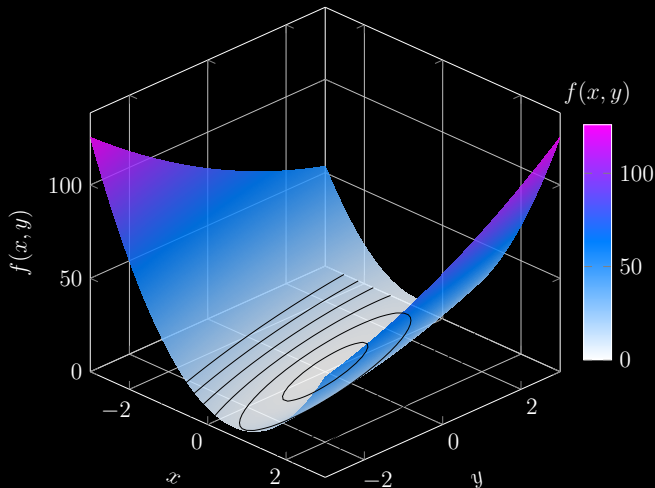

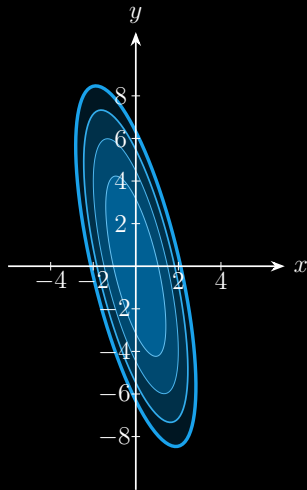

Quadratic Function $f(x, y) = 9x^2 + 4xy + y^2$

The Geometry of Quadratic Function $f(x, y) = 9x^2 + y^2$

The Geometry of Quadratic Function $f(x, y) = 9x^2 + 4xy + y^2$

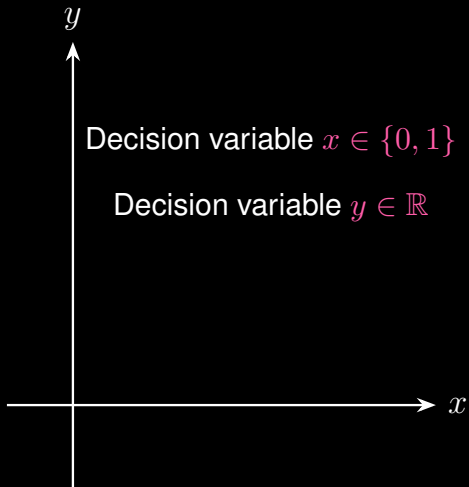

Outline:

- ✓ Linear programming
- ✓ Quadratic programming
- ✓ Geometry of quadratic function
- ✗ Mixed-integer quadratic programming

Mixed-Integer Quadratic Programming

Optimization problem:

$$\begin{array}{ll}\max_{x \in \{0,1\}, y \in \mathbb{R}} & 9x^2 + y^2 \\ \text{s.t.} & x, y \geq 0 \\ & 3x + 2y \leq 18 \\ & -x + 2y \geq 2 \\ & x \leq 3\end{array}$$

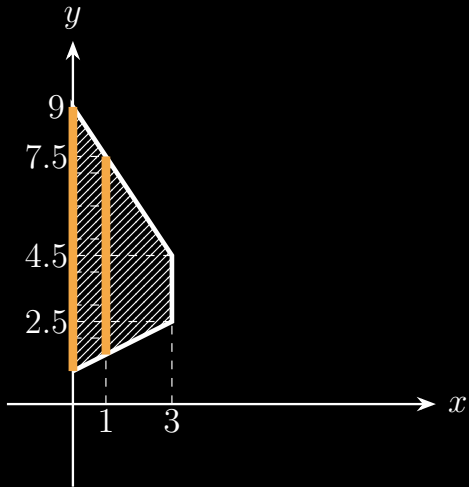

Mixed-Integer Quadratic Programming

Optimization problem:

$$\begin{aligned} \max_{x \in \{0,1\}, y \in \mathbb{R}} \quad & 9x^2 + y^2 \\ \text{s.t.} \quad & x, y \geq 0 \\ & 3x + 2y \leq 18 \\ & -x + 2y \geq 2 \\ & x \leq 3 \end{aligned}$$

Feasible solutions (—)

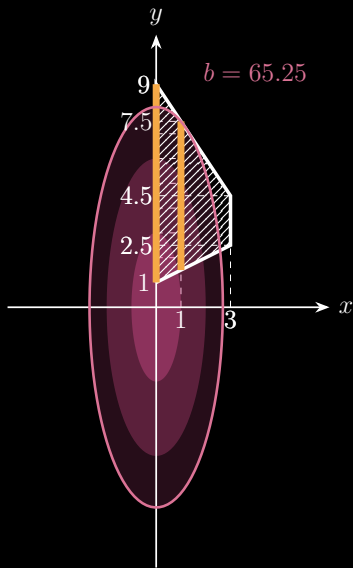

Mixed-Integer Quadratic Programming

Optimization problem:

$$\begin{array}{ll}\max_{x \in \{0,1\}, y \in \mathbb{R}} & 9x^2 + y^2 \\ \text{s.t.} & x, y \geq 0 \\ & 3x + 2y \leq 18 \\ & -x + 2y \geq 2 \\ & x \leq 3\end{array}$$

Objective $9x^2 + y^2 = b$

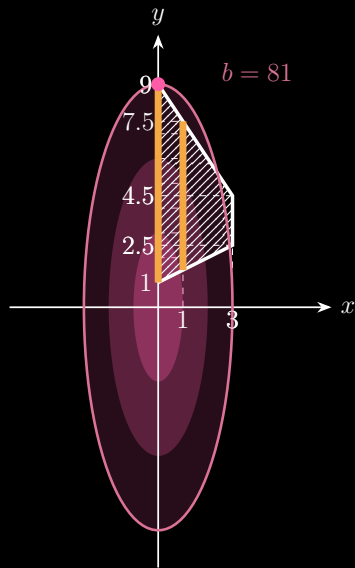

Mixed-Integer Quadratic Programming

Optimization problem:

$$\begin{aligned} \max_{x \in \{0,1\}, y \in \mathbb{R}} \quad & 9x^2 + y^2 \\ \text{s.t.} \quad & x, y \geq 0 \\ & 3x + 2y \leq 18 \\ & -x + 2y \geq 2 \\ & x \leq 3 \end{aligned}$$

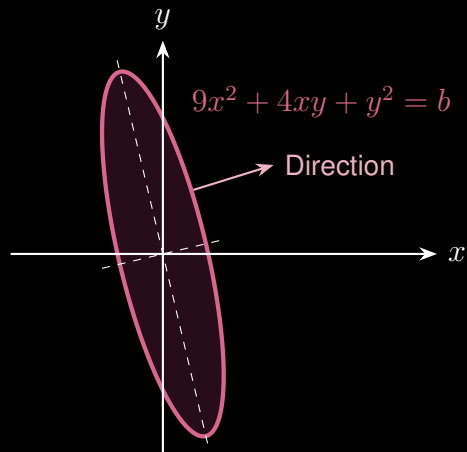

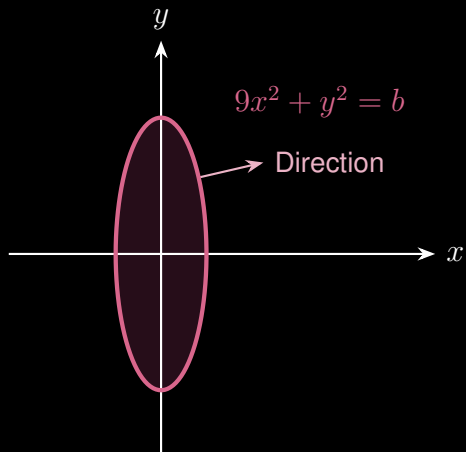

Optimal solution: $x = 0, y = 9$

$$\max_{x,y} 9x^2 + y^2$$

→

$$\max_{x,y} 9x^2 + 4xy + y^2$$

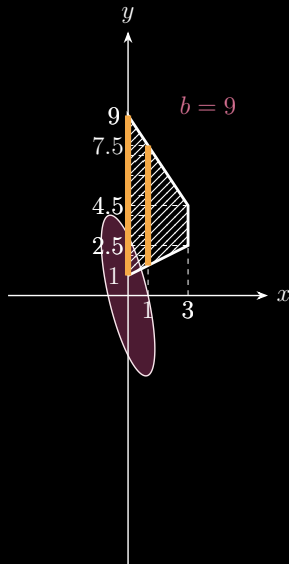

Mixed-Integer Quadratic Programming

Optimization problem:

$$\begin{array}{ll}\max_{x \in \{0,1\}, y \in \mathbb{R}} & 9x^2 + 4xy + y^2 \\ \text{s.t.} & x, y \geq 0 \\ & 3x + 2y \leq 18 \\ & -x + 2y \geq 2 \\ & x \leq 3\end{array}$$

Objective $9x^2 + 4xy + y^2 = b$

Mixed-Integer Quadratic Programming

Optimization problem:

$$\max_{x \in \{0,1\}, y \in \mathbb{R}} \quad 9x^2 + 4xy + y^2$$

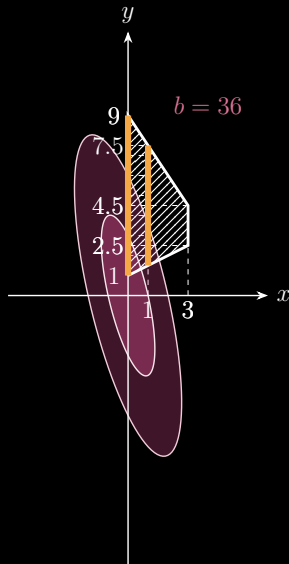

$$\text{s.t.} \quad x, y \geq 0$$

$$3x + 2y \leq 18$$

$$-x + 2y \geq 2$$

$$x \leq 3$$

Objective $9x^2 + 4xy + y^2 = b$

Mixed-Integer Quadratic Programming

Optimization problem:

$$\max_{x \in \{0,1\}, y \in \mathbb{R}} \quad 9x^2 + 4xy + y^2$$

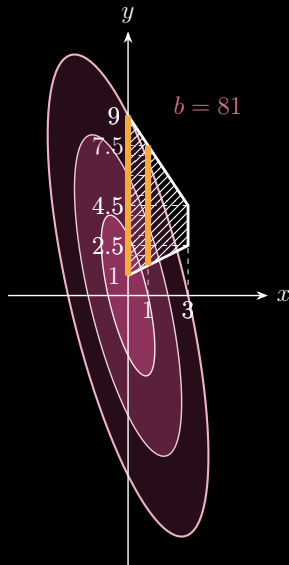

$$\text{s.t.} \quad x, y \geq 0$$

$$3x + 2y \leq 18$$

$$-x + 2y \geq 2$$

$$x \leq 3$$

Objective $9x^2 + 4xy + y^2 = b$

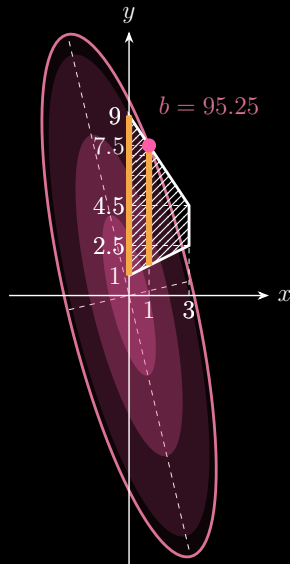

Mixed-Integer Quadratic Programming

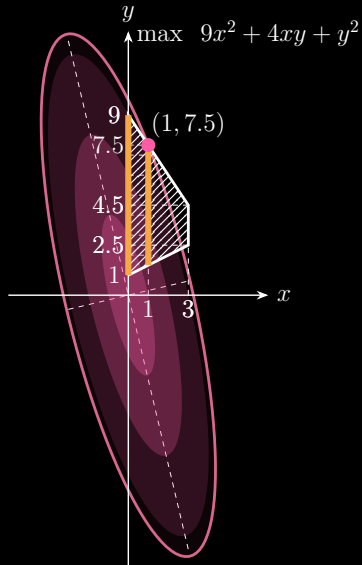

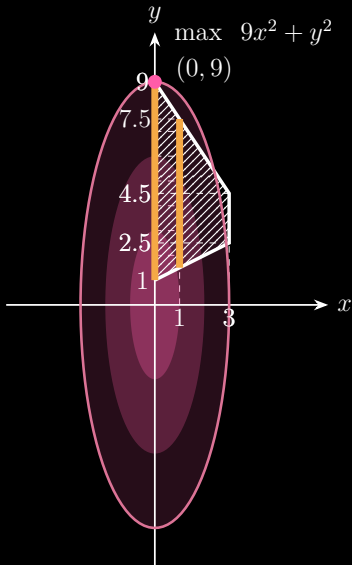

Optimization problem:

$$\begin{aligned} \max_{x \in \{0,1\}, y \in \mathbb{R}} \quad & 9x^2 + 4xy + y^2 \\ \text{s.t.} \quad & x, y \geq 0 \\ & 3x + 2y \leq 18 \\ & -x + 2y \geq 2 \\ & x \leq 3 \end{aligned}$$

Optimal solution: $x = 1, y = 7.5$

Different objectives $\rightarrow$ different optimal solutions

Quick Summary:

- ✓ Linear programming
- ✓ Quadratic programming
- ✓ Geometry of quadratic function
- ✓ Mixed-integer quadratic programming
