Bivariate Gaussian Distribution

The **level set** of a Gaussian distribution is the **set of points** in n -dimensional space with the **same probability density**.

$$\frac{1}{(2\pi)^{n/2} \sqrt{\det(\Sigma)}} \exp \left(-\frac{1}{2} (\mathbf{x} - \boldsymbol{\mu})^\top \Sigma^{-1} (\mathbf{x} - \boldsymbol{\mu}) \right) = c_0 \quad (\text{at level } c_0)$$

$$\Rightarrow \quad (\mathbf{x} - \boldsymbol{\mu})^\top \Sigma^{-1} (\mathbf{x} - \boldsymbol{\mu}) = c \quad (\text{with constant } c)$$

The **level set** of multivariate Gaussian distribution is **an ellipsoid** in the n -dimensional space, why?

$$\begin{aligned} & (\mathbf{x} - \boldsymbol{\mu})^\top \boldsymbol{\Sigma}^{-1} (\mathbf{x} - \boldsymbol{\mu}) \\ &= (\mathbf{x} - \boldsymbol{\mu})^\top \left(\sum_{i=1}^n \lambda_i \mathbf{u}_i \mathbf{u}_i^\top \right)^{-1} (\mathbf{x} - \boldsymbol{\mu}) \end{aligned}$$
